GIAC Certified Forensic Analyst (GCFA) Practical Assignment Version 1.2 (December 30, 2002)

> Alexander Kotkov Submitted March 12, 2003

> > Page 1 of 111

ABSTRACT

This paper consists of tree parts. In first part, unknown binary from compromised system was analyzed. Forensic techniques, learned at SANS training were used during this research. Second part analyses tool of my choice and evaluates its suitability for forensic purposes. I tested reliability, functionality and effectiveness of the tool. I evaluated impact created by tool on environment and status of tested system. Last part of paper discusses legal side of presented situation of incident response. Related to this situation laws are briefly discussed. And the state of the second se

Part 1 – Analyze an Unknown Binary

Introduction

In this part of practical assignment it is necessary to analyze unknown binary, seized from compromised system. There is no known facts about functionality, origin and purpose of this binary, so it is my task as forensic investigator to find it out.

Description of test environment

For conducting tests I used setup environment configured as pictured below.

Systems were configured as follows:

- AK2: Windows 2000 Server with SP3 applied; IE 6.0;
- lebenstern RedHat Linux 8.0
- ak1linux RedHat Linux 8.0

All systems are:

- non-branded PC,
- Intel Pentium-III CPU 450 MHz;
- RAM: 384 MB AK2; 256 MB lebenstern and ak1linux

All systems were installed on "sanitized" hard disks. In order to "sanitize" (wipe out all residual information) I used floppy disk based Linux OS <u>hal91</u> (created by Øyvind Kolås and located at: <u>http://jspiro.tripod.com/linux/hal91.htm</u>¹). I booted from this floppy disk and issued command:

dd if=/dev/zero of=/dev/hda

I used Windows 2000 system AK2 in order to connect to Internet for short time, using dial-up modem; download required binary files from SANS web site. After this Internet connection and modem were removed.

All systems have "private" IP addresses in class C subnet 192.168.1.0. Computers AK1 and lebenstern are connected through 100Mb Ethernet connection (used Netgear hub).

Computer ak1linux was standalone system without any network connectivity – it was used for dynamic tests of unknown binary and as precaution was isolated from other systems and Internet.

This installation was used for conducting tests of Part 1.

Practical steps

- I downloaded zip file <u>binary v1.2.zip</u> from SANS web site and burned it on CD-R disk – in order to have unmodified copy of file on read-only media. Zip file from CD-R disk was copied to hard disk partition on forensic analysis system with RedHat Linux 8.0. Linux OS was selected as platform for analysis because it has extensive set of tools, well-suited for forensic investigation.
- 2. I run command:
- zipinfo -v binary_v1.2.zip

Complete results of running this command are very verbose and due to space considerations were moved to Appendix 1.1.

The command outputs verbose information on contents of zip file <u>binary v1.2.zip</u> Few remarkable notices from results of this command:

- File system or operating system of origin: MS-DOS, OS/2 or NT FAT
- File security status: not encrypted
- File last modified:
 - File <u>atd.md5</u>: August 22, 2002, 14:58:08
 - File atd: August 22, 2002, 14:57:54
- Apparent file type:
 - File <u>atd.md5</u>: text
 - File atd: binary

File atd has timestamp: 8/22/2002, 14:57:54; file <u>atd.md5</u> time stamped 8/22/2002, 14:58:08 – time difference between file and its md5 hash file – 14 seconds. That fact, most likely can be explained that file was transferred by some means (like FTP, netcat etc) with loss of original timestamp of atd binary.

I conducted small test in order to prove this theory: created new text file on Linux system, noted MAC times of this file and after this I transferred file by FTP to Windows 2000 FTP server. Resulting file on Windows 2000 system had MAC times that were different from MAC times of original file on Linux system, but in fact were times of FTP transfer.

As soon as <u>atd</u> file was transferred from compromised system, person that handled incident run <u>md5sum</u> program in order to obtain md5 hash of original file. So, timestamp of suspicious binary unfortunately was changed and this makes much more difficult process of pinpointing time interval of initial system compromise.

3. Command:

unzip -X binary_v1.2.zip

	leben	stern	- CRT								- 🗆 ×
File	Edit	View	Options	Transfer	Script	Window	Help				
Akt i [/s tot -ru -ru	hive nfla	: b ting ting]# 1 8 ru- ru- ru-	inary_ : atd. : atd s -l 1 r 1 r			t.	39	Aug	22	atd atd.md5 binary_v1.2.	▲ zip →

As can be seen from results of running <u>Is</u> –I command immediately after unpacking files from archive, both extracted files – atd and <u>atd.md5</u> have file attributes –rw-rw-rw-. In Linux context that means that files have read/write access for root, group of owner and group "others" (everything that is not a root or member of file owner's group). What is very special about these results – in Unix/Linux world that means that binary files cannot be executed.

4. I executed command <u>md5sum</u> against file <u>atd</u> and printed on console text file <u>atd.md5</u>:

🔲 lebenstern - CRT 📃 🗙										
File Edit	View	Options	Transfer	Script	Window	Help				
48e8e8 E/sans	ed305 3]# c ed305	at atd	7e638fa			atd atd	•			

Results of these commands show that file <u>atd.md5</u> contains valid md5 hash of file <u>atd</u> – that means, that file <u>atd</u> was not modified since md5 hash was created for it. That is very important and proves that we deal with original binary, seized from compromised system.

5. Next, I run command file in order to find out type of atd file:

🔲 lebenste	rn - CRT			- 🗆 ×
File Edit Viev	w Options Tran:	fer Script Win	ow Help	
				886, version 1 (SYSV), stripped

Output of this command provides us with following information:

- File <u>atd</u> is 32-bit executable in ELF format (that is one of formats for executable files on Linux platform);
- File was compiled for execution on Intel 32-bit CPU 386 or later,
- File is dynamically linked (uses shared libraries) that means, that for execution of some standard functions, this binary would rely on functionality of shared libraries. In other words, this is not self-contained executable file (It would be in case of statically linked executable). Generally, dynamic linking creates very compact size of binary;
- Executable was stripped that means that after compilation, command <u>strip</u> <u>atd</u> was run – that removes all symbols from object code. It also reduces size of binary.

By this point, few conclusions can be done:

- We have original, unmodified binary atd (md5 hash confirms that);
- Binary was compiled in order to run on Linux OS and Intel 386 or later CPU;
- UID/GID information of file was lost or modified binary file in order to be executed need to have "x" (eXecute) flag in its UID/GID – most likely it happened during initial incident response when file was transferred to DOS/Windows system (see results of <u>zipinfo</u> command, Appendix 1.1);
- Binary file atd most likely has modified timestamp of last modification results of <u>zipinfo</u> command show that it was modified only 14 seconds earlier than its md5 file. It is not likely that attacker leaves around telltale evidence like md5 files for his/her binaries most likely person that initially handled incident changed "Modified" timestamp by running some command against binary file. In 14 seconds after running this command (and modification of timestamp) md5sum command was run by incident handler that explains 14 seconds difference of timestamp.
- 6. Next, I run command strings -a -n 3

This commands searches for all NUL-terminated sequences of printable (i.e. not control or escaped) characters). Parameter <u>–a</u> means search through all file, not just data part. I supplied parameter <u>–n 3</u> for finding all strings with length 3 or more characters (default for strings command is search for 4 or more characters long strings). In fact, I tried combinations of searching for various string lengths – setting this value to 3 yielded some valuable hints (like type of encryption – XOR – it will be described in more detail in section <u>Compilation of Loki2</u>). <u>Strings</u> command create very verbose, multiline output.

Raw output of <u>strings</u> command contained a lot of "noise" (meaningless combinations of characters that formally met filtering criteria of <u>strings</u> command). I filtered out those "noise" strings; also some strings were repeated 8 times in a row – I removed duplicates as well. This filtered output of <u>strings</u> command still has a lot of entries – I moved it to Appendix 1.2 for reference. Result of running <u>strings</u> command indicates that binary was compiled using GNU version of C compiler, namely gcc (GNU) 2.7.2.1. I used <u>grep</u> filter in order to highlight just relevant lines.

🔲 lebenstern - CRT	- 🗆 🗙
File Edit View Options Transfer Script Window Help	
[/sans3]# [/sans3]# strings -a atd grep -i gcc GCC: (GNU) 2.7.2.1 GCC: (GNU) 2.7.2.1 GCC: (GNU) 2.7.2.1	•

Quick search on Internet provided release date for gcc compiler version 2.7.2.1 – June 29, 1996²

Search on <u>Google</u> search engine for release dates of RedHat Linux gives idea that it could be version 3.0.4 (Rembrandt) – released July 30, 1996³, or later version of Red Hat linux.

Additional search for RedHat Linux version released with gcc version 2.7.2.1 brought reference to RedHat 4.2 (Biltmore), released May 19, 1997⁴

Further, output of <u>strings</u> command (see Appendix 1.2 for full output) gives hint that platform for which binary was compiled – some version of Linux, as it contains line that looks like reference to Linux shared library:

🔲 lebenstern - CRT	<mark>- □ ×</mark>
File Edit View Option	is Transfer Script Window Help
[/sans3]# [/sans3]# string /lib/ld-linux.se [/sans3]# [/sans3]#	gs -a atd grep -i linux o.1 ▼

Results of command <u>readelf –a atd</u> also explicitly show references to Linux sahred libraries. Output of <u>redelf</u> command was placed in Appendix 1.3 for space considerations.

Review of <u>strings</u> program output (see Appendix 1.2) reveals name and version number of program: lokid 2.0. I used <u>grep</u> filter in order to highlight just relevant lines. Parameter "–i" of grep program makes search case-insensitive.

Parameter "-C 1" means: print in context – in this case, starting one line before of line, matching filter criteria and ending one line after it.

🔲 lebenstern - CRT		- 🗆 🗙
File Edit View Options Transfer	Script Window Help	
[/sans3]# strings -a -n 2.0 lokid version: remote interface: [/sans3]#	3 atd grep -i -C 1 version %s %s	•

Further scrutinizing of <u>strings</u> output (or use of <u>grep</u> filter) finally hit what can be considered goldmine in this situation: Copyright information. Specially constructed <u>grep</u> filter with parameters:

-I — for case-insensitivity; (c) — regular expression for search of (c) — Copyright symbol. Symbols (and) are prefixed by backslash ("escaped") because they have special meaning in regular expressions.

	leber	istern	- CRT					_ 🗆 X
File	Edit	View	Options	Transfer	Script	Window	Help	
E/s LOk E/s]# s rou]# _		-a -n) 1997				\(c\) on worldwide]

This output gives us:

- name of program: LOKI2
- copyright information: route [(c) 1997 guild corporation worldwide]

Search on <u>Google</u> search engine with keywords "loki2" "guild" lead to article "LOKI2 (The Implementation) in online Magazine "Phrack"⁵.

This article (and pre-dating it article "Project Loki" in the same magazine Phrack⁶ describe concept and proof of concept implementation of concealing network traffic of virtually any nature within ICMP traffic.

Normally, ICMP traffic is used for network diagnostics and troubleshooting (commands such as <u>ping</u> and <u>traceroute</u> use it). Due to this functionality ICMP traffic very often is enabled to pass firewalls, thus making it convenient transport for establishing covert channels of network traffic. In fact, this concept exploits

Page 10 of 111

the fact that standard ICMP packet has data area (default size: 56 bytes) that is very seldom used and almost never analyzed by firewalls.

In fact, even RFC 792⁷ that serves as standard for ICMP protocol does not specify contents of data field for ICMP_ECHO and ICMP_ECHOREPLY messages. It merely mentions that: "The data received in the echo message must be returned in the echo reply message".

Loki program uses as transport ICMP packets of type 0x0 – ICMP_ECHOREPLY (reply) and 0x8 - ICMP_ECHO (query). Program loki2 "tunnels" any other network protocol inside usually unused data field of ICMP_ECHO and ICMP_ECHOREPLY packets, creating covert channel for information exchange. Loki2 can be configured to transmit "hidden" data in plaintext (this is not safe option, as traffic can be intercepted by IDS or network sniffer) or payload can be encrypted – with simple logical XOR operation or more elaborate encryption techniques such as Blowfish and DH.

This kind of covert network traffic is quite difficult to detect. Reliable signature of this kind of exploit – unusually high level of ICMP traffic from single IP address. Network sniffer and well-tuned network IDS can be helpful in detecting this backdoor.

Timeframe of Phrack publication about LOKI2 (Published: September 01, 1997) correlates well with earlier findings about approximate timeframe of <u>atd</u> compilation.

Some notes on covert channels

Covert channels are quite an interesting area for computer forensic investigator. I would define it "in layman terms" as "network steganography" or "art and techniques to hide not allowed communications inside legitimate communications".

U.S. Department of Defense in document "Trusted Computer System Evaluation Criteria December" provides following definition:

"A covert channel is any communication channel that can be exploited by a process to transfer information in a manner that violates the system's security policy⁸".

<u>Loki</u> tool is one of relatively "old", well-known tools that exploit ICMP protocol in order to create covert channel. ICMP is not the only protocol that is being used for creation of covert information channels. There are tools that create covert channels in legitimate DNS⁹, Telnet, HTTP¹⁰ traffic.

TCP protocol also was used for creation of covert channels. Article by Craig H. Rowland "Covert channels in the TCP/IP protocol suite¹¹" (

http://www.firstmonday.dk/issues/issue2_5/rowland/) provides good analysis of this topic.

IP network protocol also has its share of applications that create covert channels. Article "A brief programming tutorial in C for raw sockets ⁴² by Mixter (<u>http://mixter.void.ru/rawip.txt</u>) provides mix of theory and samples of code that utilize IP network protocol for creation of covert channels.

Compilation of Loki2

Article in Phrack online magazine (Phrack, Vol.7, Issue 51, article 06) contains full source code of LOKI2 in C programming language. For proper functionality source code need to be extracted by special program <u>extract</u> (also provided as C language source code). I compiled <u>extract</u> program using command:

```
gcc -o extract extract.c
```

🔲 lebenstern	- CRT		- 🗆 🗙
File Edit View	Options Transfer	Script Window	v Help
	c -o extract -la extract 1 root 1 root 1 root 1 root 1 root		13009 Jan 25 20:05 extract 1457 Jan 3 11:32 extract.c 62917 Jan 3 11:41 extractloki2 2524 Jan 3 11:28 extract.txt

Following instructions of Phrack article, I extracted source code (in C programming language) of Loki2 program from text of article:

🖿 lebenstern - CRT	- 🗆 🗙
File Edit View Options Transfer Script	Window Help
<pre>[/loki]* ./extract Phrack51- - Extracting L2/Makefile - Extracting L2/client_db.c - Extracting L2/client_db.h - Extracting L2/crypt.c - Extracting L2/loki.c - Extracting L2/loki.h - Extracting L2/loki.h - Extracting L2/lokid.c - Extracting L2/lokid.c - Extracting L2/lokid.c - Extracting L2/lokid.c - Extracting L2/lokid.c - Extracting L2/lokid.c - Extracting L2/lokid.c.c - Extracting L2/lokid.c - Extracting L</pre>	
-rwxr-xr-x 1 root roo drwx 3 root roo -rw-rr 1 root roo [/loki]#	t 4096 Jan 29 22:01 L2

I read compilation instructions for program LOKI2, provided on Phrack web site. Instructions have few options for compiling LOKI2 program.

One of the options – encryption strength. There are 3 options available:

- STRONG_CRYPTO (DH and Blowfish)
- WEAK_CRYPTO (XOR)
- NO_CRYPTO (data is transmitted in plaintext)

Targeted review of <u>strings</u> command output (see Appendix 1) indicates that this binary was compiled with option: XOR

🔲 le	ben	stern	- CRT					-	
File E	Edit	View	Options	Transfer	Script	Window	Help		
	<pre>[/sans3]# strings -a -n 3 atd grep -i -C 1 XOR active transport: %s </pre>								
XUR active cryptography: [/sans3] #			Xs				•		

With this information, I left encryption type in Makefile as WEAK_CRYPTO (XOR) – in fact it was default. Below is the beginning of Makefile (that is used to provide compiler with selected options). I used grep filter with parameter "-v ^\$" in order to filter out blank lines:

🔲 lebenstern - CRT		- 🗆 ×
File Edit View Options Transfe	r Script Window Help	
	un Jul 27 21:29:28 PDT 1 Corporation, Worldwide	997
CRYPTO_TYPE *CRYPTO_TYPE *CRYPTO_TYPE [/sans/L2]*	= WEAK_CRYPTO = NO_CRYPTO = STRONG_CRYPTO	<pre># XOR # Plaintext # Blowfish and DH </pre>

Because during string analysis I have not found clear indications of values for other adjustable parameters (Phrack article documents few others, like type of terminal and delay interval between transmissions), I decided not to change other compilation options.

In order to compile and link LOKI2 program I run command:

```
make linux
```

Program failed with number of C-compiler parsing error messages. Full output of this attempt can be found in Appendix 1.4.

Forensic investigation system has RedHat Linux 8.0 (released: September 2002) with gcc compiler version 3.2 20020903. As I mentioned earlier, binary obtained from compromised system was compiled with gcc (GNU) compiler version

Page 13 of 111

2.7.2.1 that was bundled with RedHat Linux 4.2, released in May, 1997. C programming language is well standardized and provides excellent portability on source code level, but for more than 5 years between release of RedHat Linux versions 4.2 and 8.0 some minor changes in location of header types and their content could happen. After some educated guesswork and few attempts to correct the situation, I was able to compile successfully LOKI2 program on RedHat Linux 8.0 system. Modification that was required (at least the one that produced error-free compilation and linking) was editing header file "loki.h", included in source code, published in Phrack. Details of modification can be seen in output of <u>diff command</u> (file loki.h in current directory – unmodified, from Phrack; file loki.h in /sans/L2/ directory was modified):

🔲 let	ensterr	i - CRT					- 🗆 ×
File Ed	lit View	Options	Transfer	Script	Window	Help	
35a36 > > #ir 38c40	,37 clude	Kas∎/t	loki.h ypes.h :/signal	>	s/L2/1c	bki.h	-
) [/lok	i/L2]#	•					•

Finally, running command:

make linux

resulted in successful compilation and linking of LOKI2 program – in fact, it produced two executable files – <u>loki</u> and <u>lokid</u> – as can be seen from results of running command <u>ls –lt</u>:

Comparison of files atd and lokid

File size

Binary file <u>lokid</u> that was created from source code for LOKI2 program has size 16088 bytes; binary from compromised system – file <u>atd</u> – has size 15348 bytes. Size of binaries is different, but very close. Difference in size can be explained by compilation with different version of gcc compiler, potentially files were compiled with different compilation options.

MD5 hash

Running command <u>md5sum</u> produced different md5 hash for files lokid and atd – it can also be explained by compilation with different versions of gcc compiler.

🔲 lebenstern - CRT	- 🗆 🗙
File Edit View Options Transfer Script Window Help	
[/sans2]# md5sum lokid 93319cdb20ebae9e4a297e09e14ad67a lokid [/sans2]# md5sum /sans3/atd 48e8e8ed3052cbf637e638fa82bdc566 /sans3/atd [/sans2]# _	•

File. Strings

In order to indirectly compare files, I run <u>file</u> and <u>strings</u> programs against lokid binary. Output of <u>file</u> command was identical for files <u>lokid</u> and <u>atd</u>:

	leber	istern	- CRT									- [×
File	Edit	View	Options	Transfer	Script	Window	Help						
lol dyi E7: 7si SV	kid: namic sans2 ans3/	ELF ally]# f /atd: ynami	linke ile /s ELF 3	kid LSB ex al (use: ans3/al 2-bit l linked	s shar :d _SB e:	red lik kecutak	os), s ole,]	stripp [ntel	ed 803	86, v			

Running <u>strings -a -n3</u> command against binary lokid produced results, almost identical to running <u>strings -a -n3</u> on atd binary. Full list of strings, obtained from <u>lokid</u> file can be found in Appendix 1.6. Meaningful strings that were different are those related to version of gcc compiler, which should be expected (as I mentioned earlier, I used gcc compiler provided with RedHat Linux 8.0, while file <u>atd</u> was compiled with older version of gcc compiler).

Strace

Result of execution command <u>strace ./lokid</u> can be found in Appendix 1.7. Review of results obtained from execution of same command against file <u>atd</u> (results are in Appendix 1.5) shows a lot of correlation between results.

Banner

Banners of binary files atd and lokid are identical, as screenshots below indicate.

🛄 165.181.216.41 (5) - CRT	
File Edit View Options Transfer Script Window	Help
11 X X X h & Y < 5 4 f	7 🕸 🤋 🐵
Eroot@lebenstern sans2]# ./lokid LOKI2 route [(c) 1997 guild corpo Eroot@lebenstern sans2]#	▶ mration worldwide]
Ready Telnet 2, 26 7 I	Rows, 58 Cols VT100

- 🗆 🗙

Comparison, conducted by using techniques and tools described above can serve as indirect prove that <u>atd</u> and <u>lokid</u> are most likely essentially the same program. Minor differences between can be attributed to different versions of OS and gcc compiler.

Dynamic analysis of <u>atd</u> binary

Based on results of running <u>readelf –a atd</u> command (see Appendix 1.3 for complete printout), I realized that it will require libc.so.5 and Id-linux.so.1 shared libraries. According to article at RPMfind.net¹³:

"Older Linux systems (including all Red Hat Linux releases between 2.0 and 4.2, inclusive) were based on libc version 5. The libc package includes the libc5 libraries and other libraries based on libc5. With these libraries installed, old applications which need them will be able to run on your glibc (libc version 6) based system."

As I found earlier, binary <u>atd</u> most likely was compiled for RedHat Linux 4.2. In order to provide <u>atd</u> binary with necessary shared libraries, I downloaded from the same rpmfind.net web page necessary RPMs for shared libraries and installed them on stand-alone PC with RedHat Linux 8.0 – I decided to use separate PC, disconnected from any network and Internet in order to avoid potential contamination of other systems by unknown binary <u>atd</u>.

Before executing <u>atd</u> binary on test system, I run few commands in order to obtain "pre-run" information.

1. Executed command:

ps -Af

This command provides information about all processes, currently running on system. Parameter \underline{f} prints out information in "full" format. Output was long enough and I do not include it because of space considerations. Interestingly enough, I noticed that process with name <u>atd</u> was listed as running on the system.

First command issued:

ps -Af | head -n 1

is provided for convenience - it types column headers for subsequent output.

Page 17 of 111

Next command:

ps -Af | grep atd

filters out only line that contain search criteria "atd"

As can be seen, 3 processes match this search criteria; of these 3 processes process with PID = 699 is direct hit – it points to program that was started as /usr/sbin/atd

	lebens	tern - C	RT								- 🗆 🗙
File	Edit V	/iew Opt	ions	Trans	fer	Script	Window	Help			
UID		* ps - PII * ps -	P	PID	С	STIME	TTY		TIME	CMD	-
rpc dae roo	user ∎on t	453 699 2 <u>6</u> 785		1 1	0 0	Jan09 Jan09	-	L	00:00:00	rpc.statd /usr/sbin/atd grep atd	÷
IL/S	ans2]	•									

Quick search on Internet showed that atd is daemon for scheduling program \underline{at} – it is simpler, but less flexible scheduler than <u>cron</u> is. It allows scheduling programs for single execution only and has very simple syntax, like¹⁴:

```
at 13:00 today
at 1 PM today
at noon tomorrow
at 23:00 19.02.03
```

This discovery gives another hint – person that installed atd binary:

- Has decent knowledge of Linux system most likely he/she is not a "script kiddie";
- Wanted to conceal this process by naming (or renaming) it to name of standard Linux daemon – that leads to conclusion that it was not just harmless toy or experiment.

2. Assigning "Execute" flag to atd binary

As I noted earlier, <u>atd</u> file does not have \underline{x} flag, so it cannot be executed (most likely, file attributes were modified during initial incident response). I run command:

chmod 777 atd

- this command assigns all permissions (read, write, execute) to all users (root, group, other):

<u>Fi</u> le <u>E</u> dit <u>V</u> iew	<u>T</u> erm	inal <u>G</u> o	<u>H</u> elp						
[~/sans]# chi			3						
[~/sans]# 1s	-1	atd*							
TWXTWXTWX	1	root	root	15348	Aug	22	14:57	atd	
-rw-rw-rw-	1	root	root	39	Aug	22	14:58	atd.md5	
[~/sans]#									

3. I run atd program by typing command:

./atd

Program showed banner, that confirms initial assumption that <u>atd</u> binary is renamed <u>lokid</u> program. Banner exactly matches string that can be found in C source code of <u>loki2</u> program (that produces two binaries – server – <u>lokid</u> and client – <u>loki</u>).

4. Execution of command

netstat -lp_atd

shows that <u>atd</u> program opened two raw network sockets – one of them listens for icmp protocol.

💙 root@ak1	inux:~/sans				laidaddallaidad - 🗖 🕴
<u>File E</u> dit	<u>View T</u> erm	inal <u>G</u> o <u>H</u> elp			
[~/sans]	# netsta	at -lp grep atd			-
tcp	0	0 *:32768	*:*	LISTEN	530/rpc.statd
udp	0	0 *:32768	*:*		530/rpc.statd
raw	0	0 *:icmp	*:*	7	1036/atd
raw	0	0 *:255	*:*	7	1036/atd
[~/sans]	#				

5. Running command:

ps -aux

shows that PID of process for atd - 1036.

<u>File E</u> dit	<u>View</u> <u>T</u> err	ninal <u>C</u>	<u>Go</u> <u>H</u> elp)						
[~/sans]:	#ps-a	ux	grep	atd						
rpcuser	530	0.0	0.2	1444	724	?	S	22:08	0:00	rpc.statd
daemon	764	0.0	0.2	1292	524	?	s	22:08	0:00	/usr/sbin/atd
root	1036	0.0	0.1	936	348	?	s	22:20	0:00	./atd
root	1062	0.0	0.2	1640	656	pts/1	т	22:27	0:00	less readelf_atd.
root	1105	0.0	0.2	3204	616	pts/0	s	22:39	0:00	grep atd

6. Execution of command:

lsof -p 1036

shows files that are opened by process with PID 1036 (in this case, atd):

💙 root@ak:	llinux:~	/sans			i di manta	sinnal and the	nan an	
<u>File E</u> dit	<u>V</u> iew	<u>T</u> erminal	<u>Go</u> <u>H</u>	elp				
[~/sans]	# 1s	of -p	1036					
COMMAND	PID	USER	FD	TYPE	DEVICE	SIZE	NODE	NAME
atd	1036	root	cwd	DIR	3,2	1024	26521	/tmp
atd	1036	root	rtd	DIR	3,2	1024	2	1
atd	1036	root	txt	REG	3,2	15348	65481	/root/sans/atd
atd	1036	root	mem	REG	3,2	25386	73542	/lib/ld-linux.so.1.9.5
atd	1036	root	mem	DEL	0,4		1015827	/sysv000004fd
atd	1036	root	mem	REG	3,5	2176218	242881	/usr/i486-linux-libc5/lib/libc.so.5.4.44
atd	1036	root	1u	CHR	136,1		3	/dev/pts/1
atd	1036	root	2u	CHR	136,1		3	/dev/pts/1
atd	1036	root	3u	raw			4610	00000000:0001->00000000:0000 st=07
atd	1036	root	4u	raw			4611	00000000:00FF->00000000:0000 st=07
[~/sans]	#							

We can see from results of running this command, that <u>atd</u> opens two raw connections (sockets) and uses few system libraries.

7. I killed process with PID 1036 by typing command:

kill -1036

After this I verified with command:

ps -aux

that process was terminated.

8. Running command:

strace ./atd

shows system calls that are executed by program (complete printout of \underline{ps} – aux command can be found in Appendix 1.5). Interesting lines:

- 57 and 59 create SOCK_RAW for IPPROTO_ICMP and PPROTO_RAW;
- 66 prints program banner LOKI2.

Page 20 of 111

Legal Implications

Installation and use of program <u>atd</u> (that was identified as renamed server part of Loki2 program – <u>lokid</u>) violates number of criminal laws of United States. It qualifies as offence according to United States Code (U.S.C.) § 2701 (a)(1),(2)¹⁵. Person that committed this offence can be punished with:

"(1) if the offense is committed for purposes of commercial advantage, malicious destruction or damage, or private commercial gain--

(A) a fine under this title or imprisonment for not more than one year, or both, in the case of a first offense under this subparagraph; and

(B) a fine under this title or imprisonment for not more than two years, or both, for any subsequent offense under this subparagraph; and

(2) a fine under this title or imprisonment for not more than six months, or both, in any other case".¹⁵

Another applicable law in this situation – U.S.C. § 1030 (a)¹⁶ qualifies this activity as fraud. Same section of law specifies more strict punishment if compromised computer belongs to any department of US government, financial institution, card issuer (generally referred as "protected computer"). Depending on severity of crime and additional circumstances (first or subsequent violation of this type; estimated cost of damage; if computer is "protected" or not) – punishment can be fine or various terms of imprisonment – from 5 to 20 years.

In case this program would be installed in my company, it qualifies as violation of Corporate IT Security policy that explicitly prohibits:

- installation of any remote access software or equipment, unless it is approved by IT management and IT Security department;
- installation of any software, unlicensed to Company;

Violation of Corporate IT Security policy similar to this serves as ground for immediate and unconditional termination of employee.

If this violation would resulted in substantial material loss (threshold value of loss is determined by Company's management), criminal investigation can be initiated. In this case employee, that installed tool similar to <u>loki</u> would face imprisonment and/or fine according to laws described above.

Interview questions

1. You seem to be very charismatic and intelligent person. Usually people like you have some hobbies or interests. What are you hobbies ? Are they technical in nature ?

Comment: I asked this question just to get general idea about interests of person. In case he/she indicates that hobbies are technical in nature, it is good start to continue with more detailed technical questions.

2. Let's consider the situation: you work as system administrator for this company and you live in suburban (about 2 hours of travel time from company office). Sometimes "things happen" and something does not work on your corporate network – at 2:15 am. Situation repeated few times. What would you do in order to provide prompt troubleshooting but not go every other night to your office ?

Comment: This question was asked in order to "probe" person's "mental readiness" to bypass security policy as trade-off for convinence.

3. [Question in case suspect works in company, where system was compromised]:

All workstations and servers in your company are Windows 2000 or Windows XP. Why this small PC runs some version of Linux ?

Comment: It is quite direct question, that can bring interesting answers. Non verbal communications of suspect can be very indicative after this question asked.

4. A lot of software and excellent tools exist for Linux. Some of them easy to install, but some of them you need to compile or even tweak a little to get them working. Have you ever do something like this ?

Comment: Another probe of technical skills [that are required to install Loki].

5. This company has firewalls installed. How would you test their reliability ? Comment: Question targets to find out level of "creativity" of person, that could result in Loki installation.

6. Have you practically tested reliability of your firewalls ? Comment: That is direct follow-up to Question 5.

Conclusion

Results of research allow me to make following conclusions:

 Binary <u>atd that was found on compromised system – renamed server of</u> remote access tool <u>Loki2</u>

- Date when <u>atd</u> was installed on system is unknown; also unknown if it was executed on the system and when it was executed last time – this information cannot be restored, as timestamp of file was modified
- User/group ID that was used to install this tool is unknown, as UID/GID info was lost during initial incident response
- Tool most likely was installed by person who has decent knowledge of Linux;
- Tool was renamed as <u>atd</u> in order to conceal it atd is name of legitimate Linux daemon (scheduler);
- Tool was used (or intended) to be used as tool for establishing covert network channel, capable to bypass most of firewalls.

This research shows that not following basic rules during initial incident response caused lost of valuable information about fact of execution of tool. That can (and most likely will) affect both investigation and possible trial, unless there is other evidence that can be combined with data obtained during my research and serve as basis for more complete investigation.

Part 2 – Option 2 – Perform Forensic Tool Validation

Introduction

I will evaluate as forensic tools small suite of two programs: <u>SecReport</u> and <u>Delta</u>.

Programs were written by me with following purposes:

- <u>SecReport</u> to collect standard, structured set of security-related information from Windows systems;
- <u>Delta</u> to compare any two reports, created by program <u>SecReport</u> and highlight only differences between them.

In tool <u>SecReport</u> I tried to implement some of recommended steps for collecting information during initial incident response.^{17,18}.

Usually investigator uses number of command-line tools in order to generate reports about variety of important (or potentially important) details of cyber-crime scene. In most cases, each command line tool generates output in proprietary format that is understandable to specialists, but not always that clear to nontechnical people. Due to nature of forensic investigators' activity, reports, obtained during initial response often need to be presented to non-technical audience, such as law enforcement officers, attorneys, executives etc. I attempted to create tool that collects same information, that can be obtained by variety of tools, but presents it in more structured, intuitive and logical order, that can be relatively easy understood by non-technical audience. As design constraint, I tried to make reports concise and "readable", so certainly it is not "all-in-one" tool, but rather "many-in-one" instrument for initial collection of information for investigation of computer crime. I intentionally did not include such crucial elements, as MAC times of files, dumps of Event Log, Registry etc just because these are huge amount of data that will make this report unreadable by non-technical people. Another consideration – I tried to use standard and "reputable" software for presentation and printing of reports. People (judges included) tend to trust tools and software they know, use and understand. Internet Explorer is one of popular applications, that is familiar to many people, so I decided to use it for displaying and printing information, collected during initial incident response. These considerations were implemented in tool SecReport.

Secondary design objective was providing means of computer-based comparison of any two reports. The only practical method for comparison of data, obtained by virtually any command line tool from two systems is line-by-line review of reports (unless some script or program exists to do so). From practice I realized that task of comparison data from different systems (or same system, at different moments) is quite common activity for security investigator. And, strangely

Page 24 of 111

enough, it is not automated (generic "file comparators" are not suited well for tasks like this). Result of this idea – tool <u>Delta</u> that is included in evaluated suite.

These tools proved to be useful both during day-to-day security administration of medium-size company and during initial incident response – as data collection and analysis tools.

Tools can be downloaded by typing URLs:

http://members.verizon.net/~vze3vkmg/tools/getinfo.zip or http://kotkov.tripod.com/getinfo.zip or

Current version of tools: 3.03.07.

Tools are console (command line) programs written in Visual Basic 6 programming language.

Zip file <u>getinfo.zip</u> (size: 807 Kbytes), mentioned above contains few auxiliary files and programs that required for functionality of tools. Here is brief description of each file:

2. Delta.exe	- tool <u>SecReport</u> – collects information from Windows system - tool <u>Delta</u> – compares 2 reports, produced by SecReport sl - auxiliary file for <u>SecReport</u> tool (provides HTML-like formatting and layout for user-friendly display and printing
4. deltarep.xsl	in viewer (IE 6.0 or later) - auxiliary file for <u>Delta</u> tool (provides HTML-like formatting and layout for user-friendly display and printing in viewer (IE 6.0 or later)
5. auditpol.exe ¹⁹	- Command line tool from MS Windows 2000 Resource Kit – used for collection of information on audit policy settings
6. fport.exe ²⁰	- Free command line tool from Foundstone.com – used for obtaining information about mapping of open network ports to processes
7. mbsacli.exe ²¹	- Free command line tool Microsoft Baseline Security Analyzer (MBSA) – used for obtaining information about installed hotfixes
 hfdll.dll mssecure.xml²² 	 Library for MBSA – part of MBSA distribution; Data file with information on MS hotfixes – downloaded
10. ToHtml.Bat	from Microsoft (required by MBSA) - Supplementary script for conversion of single XML report into HTML format
11.AllToHtml.Bat	- Supplementary script for conversion of multiple XML reports into HTML format
12. forfiles.exe ²³	- Command line tool from MS Windows 2000 Resource Kit – used for conversion of multiple XML reports into HTML
13.msxsl.exe ²⁴	format (called from <u>AllToHtml.Bat</u> script) Free command line tool for XSL transformation of XML file into HTML (called from <u>ToHtml.Bat</u>) – download from Microsoft
14. Readme.txt	- Brief instructions on usage of tools

15. GetInfo.md5 - MD5 hashes for all files included in package.

Note:

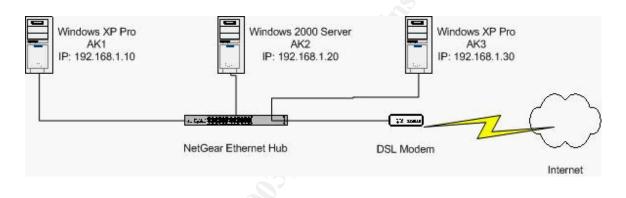

Files 1-9 are required for normal functionality of tools;

Files 10-13 are optional and required only for conversion of XML reports into HTML format (for purpose of viewing/printing reports from any browser that supports HTML 4). These files are not needed if IE 6.0 or later version is used for viewing/printing reports.

Files 14, 15 supplied as documentation.

Description of test environment for testing evaluated tools

For conducting tests I used setup environment configured as pictured below.

Systems were configured as follows:

- AK1:
 - Windows XP Professional with SP1 applied; IE 6.0-SP1;
 - o non-branded PC,
 - o Intel Pentium-MMX CPU 233 MHz;
 - RAM: 256 MB;
- AK2:
 - AK2: Windows 2000 Server with SP3 applied; IE 6.0-SP1;
 - Non-branded PC;
 - Intel Pentium-III CPU 450 MHz;
 - RAM: 384 MB;
- AK3:
 - Windows XP Professional with SP1 applied; IE 6.0-SP1;
 - Dell Dimension XPS T450;
 - Intel Pentium-III CPU 450 MHz;
 - $\circ~$ RAM: 384 MB.

All systems were installed on "sanitized" hard disks. In order to "sanitize" (wipe out all residual information) I used floppy disk based Linux OS <u>hal91</u>¹ (created by Øyvind Kolås and located at: <u>http://jspiro.tripod.com/linux/hal91.htm</u>).

Page 26 of 111

I booted from this floppy disk and issued command:

dd if=/dev/zero of=/dev/hda

All systems have "private" IP addresses in class C subnet 192.168.1.0. All computers are connected through 100Mb Ethernet connection (used Netgear hub). Systems AK1 and AK3 are configured for Internet access (through DSL connection); system AK2 is not configured for Internet connectivity. All systems were populated with variety of applications in order to provide enough information for conducting tests.

This installation was used for conducting tests of Part 2.

Scope of testing \f C \l 3

Tool <u>SecReport</u> collects wide variety of security-related information (detailed list of information, collected by tool, can be found in section: <u>Information, collected</u> <u>by tool SecReport</u>). In my testing I verified every item on report by alternative means. Where possible, I used Windows GUI or command line tools. When there is no appropriate tool, provided by OS, I used reputable tools, such as Windows Resource Kit utilities and third-party tools. Main objective of this testing was to prove validity of information, repeatability and reproducibility of results.

Tool <u>Delta</u> compares any two reports, produced by tool <u>SecReport</u> and generates report only on differences between systems. I was not able to find any other tool that does similar comparison (that is why I created the tool). I manually compared results reported by tool with actual reports from two target systems, that were compared. Objective of this testing was to verify validity of presented results. Repeatability and reproducibility in this case was not tested as manual verification was the only available alternative.

Tool SecReport

Description of tool

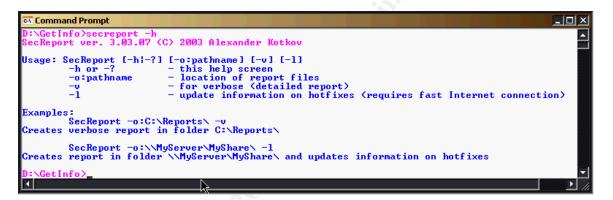

Supported platforms:

- Windows 2000;
- Windows XP;
- Windows 2003 (RC2).

Supported viewer:

MS Internet Explorer 6.0 or later,

Tool accepts few command line options. Brief description of options can be obtained by typing from command prompt: <u>secreport –h</u> or <u>secreport -?</u>.

Note: screenshot above was processed with <u>Invert Colors</u> operation in <u>Microsoft</u> <u>Paint</u>. Original output has black background, so it would be hardly visible at printout. Similar operation was conducted on few other screenshots that required that. Displayed data was not changed.

Command line options:

-h or -? – help screen

-o:pathname – location of report files (local drive; mapped network share or UNC path);

v – verbose (detailed report);

- I – update information on hotfixes (this option requires fast Internet connection).

For data collection during incident response and forensic investigations it is recommended to specify location for report files either on removable media (floppy or zip disk) or mapped network share or UNC path – that will avoid creating any files on local hard disk partitions. By default, if reports are not redirected (by using command line option: <u>-o</u>), report files will be placed into root of %SystemDrive% (which is in most cases means C:\).

Tool creates three files:

 Report file – its filename is created by following template: *Computername_YYYYMMDDThhmm.xml* Where *Computername* – name of Windows system (NetBios name or host part of fully qualified DNS name);

YYYY - 4-digit year of tool execution;

MM - 2-digit month of tool execution (it has "leading zero" format, so for months: January - September – it will be corresponding numbers: 01 – 09; DD - 2-digit day of tool execution (it also has "leading zero" format, so for days 1-9 – it will look like: 01 – 09);

hh – 2-digit hour of tool execution (in "military" time format, 0-23, with "leading zero");

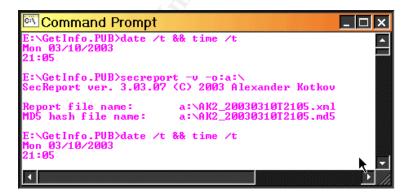

mm-2-digit minute of tool execution (with "leading zero").

For example, report for computer with hostname *AK1*, in case tool <u>SecReport</u> was executed March 10th, 2003, at 21:05, filename of report will be: AK1 20030310T2105.xml

Note: Date and time format used for naming report files conforms with recommendations of ISO 8601 standard (description of this standard can be found in article written by Markus Kuhn: "A Summary of the International Standard Date and Time Notation"²⁵ -: <u>http://www.cl.cam.ac.uk/~mgk25/iso-time.html</u>).

 File with MD5 hash of report file. This file has same filename, as report file, but extension .md5. For example, md5 file for report on computer with hostname AK1, in case tool <u>SecReport</u> was executed on March 10th, 2003, at 21:05, filename with md5 hash of report file will be: AK1 20030310T2105.md5

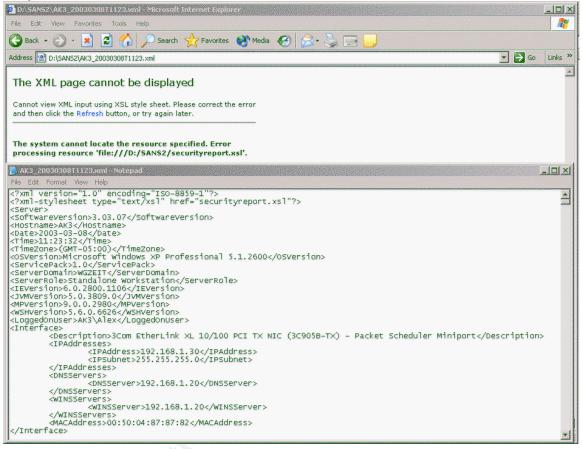

Creating of MD5 hash file from all data obtained during incident response and forensic investigation is a standard practice. Generating MD5 hash allows to create credible reports and serve as supporting information for maintaining "chain of custody" for reports.

• Auxiliary file *securityreport.xsl* – this is file-translator. It needs to be present in same directory where report file(s) placed. Tool will work without it, but report file will look as raw xml – which is more "machine-readable" format, rather than "human-readable". Screenshot below illustrates situation when

Page 29 of 111

securityreport.xsl file is missing: browser gives an error message. If select option (in IE 6.0 browser): <u>View – Source</u>, raw XML report will be opened with Notepad (or other default editor). Report is still readable, but definitely it is not "user-friendly" because of XML tags (they are similar to HTML tags in syntax). Alternatively, report file can be opened and printed in raw xml format from any plain text editor.

There are three main reasons that XML was selected as format for report files:

- XML provides "self-describing" data. As can be seen from screenshot, report surrounds atomic pieces of information with tags such as <HostName> or <LoggedOnUser>. Review of raw xml report can be useful when report is challenged in court, as it eliminates "translation" part (that is provided by securityreport.xsl file) and represents by itself "first-generation" data.
- By modifying "translation" file *securitreport.xsl* it is possible to change look of "human-friendly" report without changing data in report itself. That can be useful for presentation of report to different audience (technical vs. nontechnical etc) or for eliminating details that are not relevant for particular case.
- XML format of data is very convenient for processing by software (and presented suite of tools uses this functionality – it will be addressed in detail in section about <u>Delta</u> tool).

Report files need to be transferred, if necessary (it is necessary in case of incident response) to other system for storage and analysis.

When report file and "translating file" <u>security reprt.xsl</u> are placed into same directory, report can be viewed by clicking on report file *Computername_YYYYMMDDThhmm.xml*. In the rest of this document, unless

specifically noted, by word "Report" I will refer to file *Computername_YYYYMMDDThhmm.xml*. Clicking on report file opens it with Internet Explorer (this is Windows system default). If system configured with nondefault settings and associates files with extension .xml with some other software, report can be viewed by right-clicking on report file and selecting menu option: Open With...- Internet Explorer. Systems with IE 6.0 or later will open properly formatted report. Report can be printed from IE 6 by issuing standard print command from browser. <u>File – Print</u>.

In order to prevent printed report from being truncated, it is recommended to set font size of browser to <u>Smallest</u> (IE 6 command: <u>View – Text Size – Smallest</u>) before printing.

Windows system, where <u>SecReport</u> tool executed (in further text I will refer to them as <u>Target system</u>) can have any version of Internet Explorer (Windows 2000 was originally shipped with IE 5.0, so in reality that is oldest possible version of IE on Windows 2000 platform; Windows XP was shipped with IE 6.0).

Information, collected by tool SecReport

Sample report (placed due to space considerations in Appendix 2.1), indicates that following information was collected from target system:

- Hostname (NetBios name or host part of full DNS name);
- Timestamps of tool execution (start and finish);
- Timezone setting of system;
- Operating system (detailed version number);
- Service pack level;
- Server domain (NT domain);
- Server role (domain controller, standalone server, workstation etc);
- IE version (detailed version number);
- Java Virtual Machine (JVM) version (detailed version number);
- Media Player version(s) some systems can have more than one version of this software installed;
- WSH version (WSH Windows Script Host);
- Logged on user name;
- Network configuration (NIC card(s) brand and model; IP Address(es); default gateway; IP subnet mask; DNS server(s); WINS server(s); MAC address);
- Audit policy settings. To collect audit policy settings, tool uses command line tool <u>auditpol.exe</u>¹⁹ from Windows 2000 Resource Kit.
- Event log settings (size, type of overwrite, eventlog filename);

- Applications installed;
- Microsoft security hotfixes, explicitly installed on system. For collection of information about installed hotfixes, tool parses output of free Microsoft command line tool <u>mbsacli.exe</u> (formerly known as <u>hfnetchk</u>)²⁶.
- Services each server described by its name, startup type, current status, service full (descriptive) name; service account;
- Basic configuration information for Internet Information Server (IIS), if it is installed:
 - names of accounts for Anonymous internet access and WAP (they have standard naming template, but often renamed for security considerations);
 - strengths of passwords for these accounts passwords that have length 7 characters or less are are displayed; all other passwords substituted by string of 14 asterisk characters (default mode). If "verbose" mode specified (tool called with parameter: <u>–v</u>) then any passwords (for IIS anonymous accounts) are displayed;
 - information about location of IIS log directory;
 - \circ version of URLScan²⁷, if installed;
 - o information on ISAPI filters, their priority and order of their load;
 - DLL application mappings information this kind of information allows at glance determine if system is potentially vulnerable to such exploits as CodeRed and Nimda;
- Ports (network) open number of port, protocol (TCP or UDP), Process ID (PID) of process that owns this port, short name of process and full path to program. For collection of information about open network ports and processes that own them, tool parses output of free command line tool <u>FPort.exe</u> ver. 2.0, that can be downloaded from Foundstone at <u>http://www.foundstone.com/knowledge/intrusion_detection.html</u> ¹³
- Active processes process name; process ID (PID), process ID of parent process, thread count, handle count, command line that started process. For some system processes <u>command line</u> property is not applicable;
- Page file settings location and filename(s); initial size, maximum size;
- Hardware information:
 - Brand of computer system;
 - o Model;
 - Serial No. of computer;
 - Number of processors;
 - BIOS version;
 - BIOS date;
 - RAM size;
- Details for each CPU ID, Manufacturer; Type, CPU performance, MHz, L2 cache size, clock rate of CPU's external bus;
- Logical disks drive letter, description; filesystem; total size; free space, volume name (for mapped network drives – name of mapped share); serial No. of volume (assigned by OS);

- Physical disks: device ID, model, interface, size, number of partitions, number of bytes/sector, number of sectors/track, number of cylinders, number of heads, number of sectors, number of tracks, number of tracks/cylinder.
- Presence of installed Recovery Console;
- Date of Norton Antivirus signature²⁸ (in case this software is installed).;
- Name and version of software that generated report.

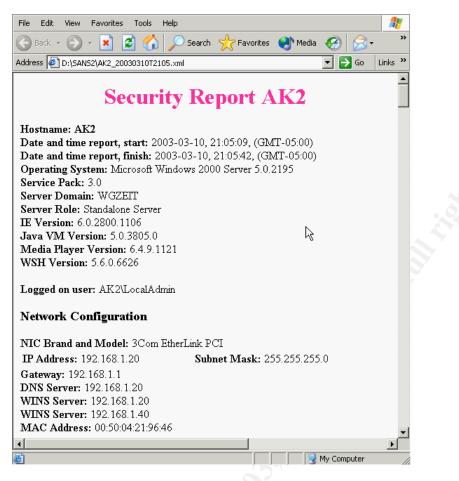

<u>Execution time</u>: varies from system to system and depends of both hardware performance and complexity of configuration. For typical Pentium-III class server with IIS installed it takes about 20 sec. to complete report – if report is directed on hard drive or network partition. Time approximately doubles if 1.44 MB floppy disk is used as media for report.

Validity verification for information collected with tool SecReport

Due to wide spectrum of information collected by tool <u>SecReport</u>, I used variety of tools and techniques to verify validity of information, presented by report. General approach: where possible I used standard Windows OS tools (GUI or command line) to cross-check information in report. In situations where native Windows tools do not provide information that is verified, reputable third-party tools were used.

Verification of Hostname, Operating system, Service Pack, Server domain, CPU type and speed, RAM size.

On screenshot below presented fragment of report, generated by <u>SecReport</u> (full report was placed due to size considerations in Appendix 2.1) This section of report contains general information about Windows system and network configuration.

This information was verified by checking data provided by Windows GUI and Windows command line tool <u>ipconfig</u> and Windows Resource Kit tool <u>whoami</u>.

General Network Identification Hardware User Profiles Advanced	General Network Identification Hardware User Profiles Advanced
System: Microsoft Windows 2000 5.00.2195 Service Pack 3 Registered to: Alexander Kotkov 51876-005-0423705-05393 Compute: x86 Family 6 Model 7 Stepping 3 AT/AT COMPATIBLE 392,740 KB RAM	Windows uses the following information to identify your computer on the network. Full computer name: ak2. Workgroup: WGZEIT To rename this computer or join a domain, click Properties Properties. Properties
OK Cancel Apply	OK Cancel Apply

Page 34 of 111

My computer – Right-click – Properties – Tabs <u>General</u> and <u>Network</u> <u>Identification</u>

Information, obtained from this GUI tools positively verifies:

- Hostname;
- Server domain (listed as Workgroup *WGZEIT*, because server does not belong to domain, but configured as workgroup member);
- Operating system;
- Service pack of operating system;
- Type of CPU;
- Speed of CPU;
- Amount of RAM.

Screenshot of output of command line tool <u>ipconfig</u> confirms <u>Network</u> <u>Configuration</u> section of report. Command <u>whoami</u> verifies logged on user.

Command Prompt	_ 🗆 🗙
C:\>ipconfig /all

Verification of Hotfixes section of report

For verification of section <u>Hotfixes</u> I used command line tool <u>Microsoft Baseline</u> <u>Security Analyser</u> (MBSA) in "hfnetchk" mode (name of mode originates from name of previous version of software). In fact, same software – <u>mbsacli.exe</u> (and two auxiliary files for this program: <u>hfdll.dll</u> and <u>mssecure.xml</u>) are supplied as part of evaluated suite of tool and executed (as spanned process) in order to collect data on installed Microsoft hotfixes for Operating system (OS) and core components, tightly integrated with OS (IIS, IE, Media Player), also for few Microsoft Server products, such as MS SQL Server.

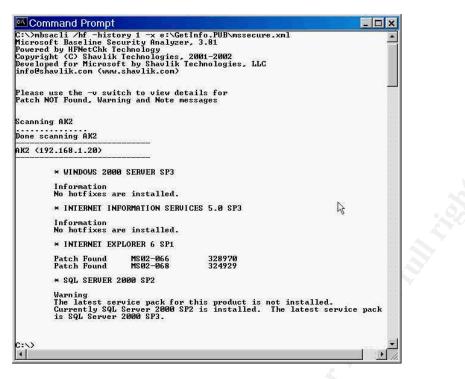

File Edit View Favorites Tools Help	2
🕞 Back 👻 🕤 👻 🚺 🔎 S	Search 👷 Favorites 🜒 Media 🥝 💙

Hotfixes	<u> </u>
Number of hotfixes: 2	▶ -
MS02-066 328970	
MS02-068 324929	
•	
é)	My Computer

I executed command:

Mbsacli /hf -history 1 -x -e:\GetInfo.Pub\mssecure.xml

Parameter <u>/hf</u> intended to run <u>mbsacli.exe</u> in "hfnetchk" mode (mode of collecting information on installed hotfixes);

Parameter <u>—history 1</u> means "show only explicitly installed hotfixes"; Parameter <u>—x —e:\GetInfo.Pub\mssecure.xml</u> specifies location of file with information on hotfixes. If this parameter is not specified, program <u>mbsacli</u> tries (without prompt) to connect to Microsoft web site in order to download latest version of file <u>mssecure.xml</u> (compressed as .cab archive). For forensic purposes it is recommended specifying location of local copy of file <u>mssecure.xml</u> — this prevents program from attempt to establish internet connection.

Execution of <u>mbsacli /hf</u> command confirmed data, presented in <u>Hotfixes</u> section of report.

Verification of Services section of report

On screenshot below fragment of section <u>Services</u> presented (full report can be found in Appendix 2.1). Validity of information in this section was verified by Windows GUI program <u>Services</u> (Start – Programs – Administrative Tools – Services).

Verification of Processes Active section of report

Page 44 of 111

For verification of section <u>Processes active</u> of report I used tool <u>psList.exe³⁰</u>, developed by Mark Russinovich. <u>PsList</u> is free tool and can be downloaded from: <u>http://www.sysinternals.com/ntw2k/freeware/pslist.shtml</u>.

Reports, generated by <u>SecReport</u> and PsInfo had some format differences (in terms of properties that are displayed for each process), but list of active processes, their order and properties that are collected in both reports (Process name, Process ID, Thread Count, Handle Count) were identical.

Screenshot of results from <u>Diskmap</u> tool. Tool was executed two times, once for every physical disk in system. Command line parameters: <u>/d0</u> and <u>/d1</u> specify number of physical disk.

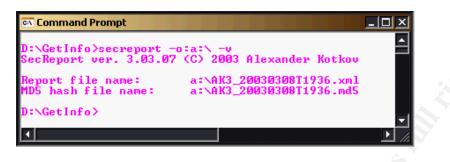

Note: On some older (usually non-branded systems), manufactured before year 2000 some information (version of BIOS, , brand, model and serial number of computer) is not provided by OS and as result, not included in report.

Results of verification for section Hardware were positive for all compared paramenters.

Page 49 of 111

Verification of MD5 hash validity

At the end of execution tool <u>SecReport</u> generates MD5 hash of report file. MD5 hash placed into file with same filename as report, but has extension .md5. File with MD5 hash placed into same folder as report. <u>SecReport</u> shows location and filenames of both files during execution.

Validity of generated MD5 hash was validated by command line GNU tool <u>md5sum</u>³² that was downloaded from <u>http://www.gnu.org/software/textutils/textutils.html</u>

📾 Select Command Prompt	_ []	×
Y:\SANS2>type_AK2_20030310T2105.m a71b6b975c63419ee4a3bdcf6e5abcc7 ↔	d5 *AK2_20030310T2105.xml	
Y:\SANS2>md5sum AK2_20030310T2105 a71b6b975c63419ee4a3bdcf6e5abcc7	.xml *AK2_20030310T2105.xml	
Y:\SANS2>	<u>×</u>	•
•	•	

Screenshot above indicates that MD5 hash, generated by <u>SecReport</u> is identical to MD5 hash value generated by command line tool <u>md5sum</u>.

How execution of tool SecReport changes status of target system

<u>SecReport</u> is command line tool that uses number of standard libraries of Windows OS. I used tool <u>Dependency Walker</u>³³ (tool is included in Microsoft Visual Studio 6 or can be downloaded from: <u>http://www.dependencywalker.com/</u>). This tool shows all libraries that are called from program. <u>SecReport.exe</u> directly calls just 2 Windows system libraries: <u>kernel32.dll</u> and <u>msvbvm60.dll</u>. These system libraries in turn call few other system libraries. Because program <u>SecReport.exe</u> uses number of system library files, it is suggested to include library files, listed in lower pane of screenshot into toolkit and use them from read-only media (such as CD-R) in order to avoid possibly trojaned binaries.

Screenshot of <u>Dependency Walker</u> program shows shared library files, used by <u>SecReport.exe</u>

To monitor files that were used during execution of <u>SecReport</u> tool I used tool <u>FileMon³⁴</u> ver.5.00 created by Mark Russinovich. FileMon can be obtained from: <u>http://www.sysinternals.com/ntw2k/source/filemon.shtml</u>. Full results of running this tool are quite verbose and were placed in Appendix 2.2. In general, <u>SecReport</u> tool uses number of Windows system libraries and files (most of them are WSH and WMI-related). It is worth to note that there are no command line tools for Windows platform that do something meaningful and do not use any system library files.

Execution of tool does not modify any settings or parameters of target system and does not create any files on target system (if output and temporary files are redirected to network share or removable media).

In order to find out what system files have they MAC time changed as result of execution of <u>SecReport</u> tool, I did small test:

• Created small batch file testmac.bat with commands:

```
@echo on
date /t && time /t
secreport -o:a:\
@echo on
date /t && time /t
```

- After I executed batch file <u>testmac.bat</u> I noted date and time of start and end of <u>SecReport</u> execution: both times were: 2/5/2003, 13:12
- I run program <u>macmatch</u>³⁵ (it was created by Arne Vidstrom and can be found at his web site: <u>http://www.ntsecurity.nu/toolbox/macmatch</u>/). This program can detect all files accessed (when executed with parameter <u>-a</u>), modified (parameter <u>-m</u>) or created (parameter <u>-c</u>) within specified time period. According to results of this program, no files were created in C:\Winnt\ directory and its subdirectories; three files were accessed and modified:
 - C:\Winnt\System32\Config\Software
 - C:\Winnt\System32\Config\Software.log
 - C:\Winnt\System32\Perflib_Perfdata_33c.dat

Because of this, it is highly suggested during incident response to use this tool <u>after</u> conducting MAC time report of file system, or (which is preferable, but not always practically feasible – after creating complete image of hard disk with <u>dd</u> or commercial imaging tools).

Recommendations on proper usage of tool <u>SecReport</u> for forensic purposes

Tool <u>SecReport</u> is single-file executable. Tool was written in Visual Basic 6 programming language and as result it uses VB6 shared library file <u>msvbvm60.dll</u>. This file supplied with default installations of Windows 2000, Windows XP and Windows 2003 (RC2) - located in folder %WinDir%\System32\. <u>SecReport</u> also spans three command line processes - <u>auditpol</u>, <u>fport</u>, <u>mbsacli</u> – in order to obtain some categories of information. Because of this, it is highly recommended to use following guidelines for usage of <u>SecReport</u> in situations of incident response and for forensic investigation:

- Place all files, provided in download archive <u>getinfo.zip</u> (can be downloaded from: <u>http://kotkov.tripod.com/getinfo.zip</u> or <u>http://members.verizon.net/~vze3vkmg/tools/getinfo.zip</u>) on read-only media (such as CD-R disk);
- Place to the same media files: <u>msvbvm60.dll</u>; <u>cmd.exe</u>. Cmd.exe file is OS-specific file, that need to be obtained from "clean" system.
- Redirect program output to removable media (floppy or Zip drive), using command line parameter: <u>-o:pathname</u>, where <u>pathname</u> is valid pathname of existing folder.
- Tool results are "sandwiched" between timestamps of start and finish of tool's execution. That allows to make necessary conclusions about scope of changed MAC (Modification, Access, Creation) times. To be on "safe" side it is recommended to run tool <u>SecReport</u> after MAC analysis.

Tool Delta

Tool <u>Delta</u> allows comparing any two reports, collected by tool <u>SecReport</u>. Reports can be collected from different systems – this is convenient in corporate environment, where most of computers are templated (by imaging software, such as Symantec Ghost ³⁶or PowerQuest DriveImage³⁷) and generally, supposed to be identical. Running SecReport and Delta tools will indicate any differences in configuration (covered by tools) between two compared systems. Applications for this type of comparison:

- Finding discrepancies in computer configurations can help detect rogue processes and applications installed on system;
- Data on hotfixes and detailed version information of major Windows components (OS, IE, Media player, Java VM, WSH etc) can allow fast assessment of potential vulnerability, that was exploited – it is based on fact that hotfixes prevent certain types of exploits. Same approach can be used in evaluating security status of IIS.

These tools were practically used in medium-size corporation for few months and were helpful in detection of few instances of unsanctioned remote access software ("backdoors").

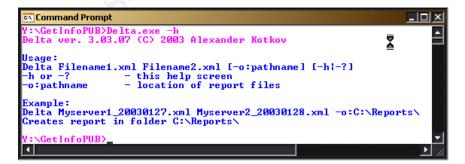

Another scenario – creating reports from same system, but at different moments – that is useful in situation when current state of computer need to be compared to certain baseline.

Possible applications for this:

- honeynet installations;
- analysis of compromised system.

Usage of tool Delta

Tool <u>Delta requires</u> two mandatory parameters – filenames of reports to be compared. Optional parameter –o:pathname allows specify location for report files. If this parameter is not specified, tool places report files into root of %SystemDrive% (usually it means C:\). Program prints short help screen if typed with parameter <u>–h</u> or <u>-?</u> or without any parameters.

Screenshot of Help screen for program Delta

Page 55 of 111

Screenshot of <u>Delta</u> program execution. Command line parameter: <u>-o:a:</u> in this example redirects output file to folder: <u>a:</u>

Tool creates 2 report files:

 Report itself with filename created by template: Delta_Computername1YYYYMMDDHHM1_Computername2_yyyymmddhhm 2.xml

Where:

- Computername1 and Computename2 names of computers compared;
- YYYY and yyyy year of running <u>SecReport</u> tool on first and second systems, respectively;
- MM and mm month of running <u>SecReport</u> tool on first and second systems, respectively;
- DD and dd day of running <u>SecReport</u> tool on first and second systems, respectively;
- HH and hh hour of running <u>SecReport</u> tool on first and second systems, respectively – in "military" format: 0-23;
- M1 and m2 minute of running <u>SecReport</u> tool on first and second systems, respectively – 0-59;
- Auxiliary file <u>DeltaRep.xsl</u> it is required for proper viewing and printing of reports in Internet Explorer 6 (this file is the same for all reports).

<u>Execution time</u> for tool <u>Delta</u> – usually about 3-5 seconds. It takes approximately 6-10 seconds to complete tool in case output is redirected to floppy disk.

Screenshot of report (fragment) generated by tool <u>Delta</u>. Report viewed (and can be printed) from IE 6.0 browser. Full report was placed in Appendix 2.3 – due to size considerations.

Notes:

- If some value printed without / (slash character), that means that values are identical for System1 and System2 (In this report, for example, values "OS Version" are identical for both systems).
- If some values printed with "/" slash between them, that means that value before slash is for System1, value after slash – for System2. In this case, values are different. In example below, Media Player Version is different for systems.

Screenshot of report (fragment) generated by tool <u>Delta</u> - section <u>Services</u>. Full report was placed in Appendix 2.3 – due to size considerations.

• If some value has syntax:

Value1 / - that means that value exists only for System1 and does not exist for System2. In example below (Table "Services", entry "lanmanserver") service lanmanserver (and it's properties) exist only for System1.

• If some value has syntax:

/ Value2 - that means that value exists only for System2 and does not exist for System1. In example below (Table "Services", entry "DefWatch") service <u>DefWatch</u> (and it's properties) exist only for System2.

How execution of tool Delta changes status of target system

Tool <u>Delta</u> does not need to be executed on any of target systems – it can be done on any Windows 2000 (or later) system. It does require IE 6.0 or later to be installed on system.

I monitored with earlier mentioned tool <u>FileMon</u> ver. 5.00 files that are affected by execution of this tool. There are very few system libraries, that this tool uses. With tool <u>Process Explorer</u> ³⁸(created by Mark Russinovich from SysInternals - <u>http://www.sysinternals.com/ntw2k/freeware/procexp.shtml</u>) I monitored processes created by execution of <u>Delta</u> and memory footprint. Tool does not span any processes. Memory footprint is extremely low during execution of <u>Delta</u>.

Testing of repeatability and validity of reports, generated by tool Delta

Results of tool <u>Delta</u> were verified by running tool against random reports and subsequent manual verification of data validity. Results, provided by tool were correct in all tests.

Screenshot of report, generated by tool <u>Delta</u> after <u>netcat</u> tool was started in "listen" mode on tcp port 8000.

I also did test as follows:

- Run <u>SecReport</u> tool on standalone Windows 2000 Professional system that generated "baseline" report;
- Disabled 2 services (Alerter and Messenger) on the system;
- Installed Adobe Acrobat Reader;
- Started <u>netcat</u> in "listen" mode port 8000 as listener port;
- Run <u>SecReport</u> tool again on same PC that generated "incident" report;
- Compared "baseline" and "incident" reports all changes that were done to the system were properly detected.

Analysis

Tool SecReport collects information on variety of parameters of Windows system, that can be useful for forensic investigation. Full list of collected information is provided in section: Information, collected by tool SecReport of present paper. Briefly, main categories of information: versions of OS and OS components, network configuration, services, processes, applications, hotfixes, IIS configuration (if applicable), hardware specifications. This information is generally collected by forensic investigator from any system under investigation. Usually set of tools, scripts etc is used to collect same information. This process is labor-intensive and error-prone. Tool SecReport also attempts to present collected information in structured, clear way, that make it more understandable by non-technical audience. Detailed verification of tool, presented earlier, proves that tool provides reliable, repeatable and reproducible information that can withstand, if challenged in court. Reports, generated by tool are "self-describing" XML files. By using supplied template security report xsl reports can be viewed and printed in "human-friendly" form from Internet Explorer 6.0.

Tool Delta serves as productivity tool in tasks of comparison of information, collected from any two systems (or same system at different moments of time). It does its job by automatically comparing number of parameters from different systems and presenting "difference" report. This is guite generic task, that is extremely time-consuming and error-prone if conducted manually.

Conclusion

Evaluation of tools SecReport and Delta as forensic tools makes me feel that these tools can be successfully used for forensic work.

These tools are:

- Detailed validation of results, obtained with tool SecReport, described in previous sections proved reliability and repeatability of results. This kind of validation allows cross-checking of results by alternative tools in case results are challenged in court.
- Monitoring of tool's impact on target system indicates that only very small number of system files change their Access time. No files are created, deleted or modified on target system.
- Tool automatically generates MD5 hash for report that it generates that is standard requirement for data, collected during incident response.
- Raw report files are structured XML files that makes them "self-describing" and "self-commenting".
- Reports, generated by <u>SecReport</u> can be viewed and printed from Microsoft Internet Explorer 6.0 or later browsers.
- Report is formatted the way that promotes understanding of results by nontechnical audience (use of logically organized sections, fonts, color etc).

Page 60 of 111

- Advantage of running <u>SecReport</u> over collecting information using standard Windows GUI tools (and some information from Windows can be obtained only through use of GUI) – significantly less impact on target system (in fact, monitoring process of just opening Control Panel with mentioned earlier tool <u>FileMon</u> shows that it involves much more activity and <u>modifies</u> files). Also, generally GUI tools do not provide standard functionality to capture displayed information in text file (in many cases, it is necessary to handwrite displayed information).
- Tool <u>Delta</u> allows to automate monotonous and error-prone, labor-intensive process of comparing data, collected from different systems (or at different times), which can be very valuable during initial incident response and subsequent analysis

Limitations of tools: support only for Windows 2000, XP and 2003 (RC-2) platforms – it is not a big disadvantage, taking into account that these versions of Windows are installed on millions of systems worldwide.

Tests that I conducted on these tools prove their functionality, reliability and repeatability.

All above-mentioned facts bring me to opinion that tool <u>SecReport</u> can be useful in arsenal of computer forensic investigator on all stages of investigation – from initial collection of information from Windows system to presenting results to law enforcement and in court.

Part 3 - Legal Issues of Incident Handling

Introduction

Presented scenario gives me, as system administrator of Internet Service Provider (ISP) legal rights to collect information that can provide help to law enforcement organizations and protect my rights and property. There are also certain procedural limitations that are dictated by law. What makes this scenario special and provides more flexibility both for law enforcement officers and for me, as system administrator of ISP – fact that hacker attacked government computer – by classification of applicable laws government computers belong to broader definition of "protected computers". Also, changes in cyber crime related laws that occurred within last two years allow effective communication between law enforcement organizations and ISP and prevent unnecessary procedural delays (that hampered many similar cases in past).

Answers to Practical Assignment questions

<u>A.</u> In described scenario, not much information can be provided during initial phone conversation, even if identity of law enforcement officer was validated. Administrator of ISP can just give general contact information, such as his name, position etc. During this initial conversation, ISP administrator can request law enforcement officer to obtain:

- Preservation request letter under <u>United States Code (U.S.C.)</u> §2703 (f)³⁹;
- Subpoena;
- Court order;
- Search warrant.

Any details, relevant to crime, cannot be divulged over the phone in described situation.

The only practical outcome of this initial phone conversation can be verbal request from law enforcement officer to preserve relevant information (but this is not recommended option) – according to <u>Searching and Seizing Computers and Obtaining Electronic Evidence in Criminal Investigations</u>⁴⁰Section III-G: "While a simple phone call should therefore be adequate, a fax or an e-mail is better practice because it both provides a paper record and guards against miscommunication. Upon receipt of the government's request, the provider must retain the records for 90 days, renewable for another 90-day period upon a government request."

<u>B</u>. In case of delay in obtaining required legal authority, law enforcement officer must provide Preservation Request Letter – according to U.S.C. §2703 (f), which mandates: "A provider of wire or electronic communication services or a remote computing service, upon request of a governmental entity, shall take all necessary steps to preserve records and other evidence in its possession pending the issuance of a court order or other process."

In case there will be further delay(s) in obtaining required legal authority,, U.S.C. §2703(f)(2) specifies that "Records referred to in paragraph (1)" (of U.S.C. §2703(f)) "shall be retained for a period of 90 days, which shall be extended for an additional 90-day period upon a renewed request by the governmental entity."

Document <u>Searching and Seizing Computers and Obtaining Electronic Evidence</u> <u>in Criminal Investigations</u> in Appendix C⁴¹ provides sample Preservation Request Letter. According to this sample, law enforcement officer can request preservation for 90 days:

- "<u>All stored communications and other files</u> reflecting communications to or from [Email Account / User name / IP Address or Domain Name (between DATE1 at TIME1 and DATE2 at TIME2)];
- All files that have been accessed by [Email Account / User name / IP Address or Domain Name (between DATE1 at TIME1 and DATE2 at TIME2)] or are controlled by user accounts associated with [Email Account / User name / IP Address or Domain Name (between DATE1 at TIME1 and DATE2 at TIME2)];
- All connection logs and records of user activity for [Email Account / User name / IP Address or Domain Name (between DATE1 at TIME1 and DATE2 at TIME2)], including;
 - 1. Connection date and time;
 - 2. Disconnect date and time;
 - 3. Method of connection (e.g., telnet, ftp, http);
 - 4. Type of connection (e.g., modem, cable / DSL, T1/LAN);
 - 5. Data transfer volume;
 - 6. User name associated with the connection and other connection information, including the Internet Protocol address of the source of the connection;
 - 7. Telephone caller identification records;
 - 8. Records of files or system attributes accessed, modified, or added by the user;
 - 9. Connection information for other computers to which the user of the [Email Account / User name / IP Address or Domain Name (between DATE1 at TIME1 and DATE2 at TIME2)] connected, by any means, during the connection period, including the destination IP address, connection time and date, disconnect time and date, method of connection to the destination computer, the identities (account and screen names) and subscriber information, if known, for any person or

entity to which such connection information relates, and all other information related to the connection from ISP or its subsidiaries."

As we can see, this letter request to preserve very broad spectrum of information, related to ISP and its subscribers.

<u>C.</u> Law officer need to provide me, as ISP system administrator, one of following documents in order to receive logs from equipment of ISP that I operate or own:

- Subpoena: According to <u>Searching and Seizing Computers and Obtaining</u> <u>Electronic Evidence in Criminal Investigations</u>, Appendix E - Sample Subpoena Language there are few valid types of subpoena for this situation:
 - Administrative subpoena authorized by Federal or State statute;
 - Federal or State grand jury or
 - Trial subpoena;
- Court order "issued by any court that is a court of competent jurisdiction" according to U.S.C. §2703 (d);
- Search warrant. See U.S.C. § 2703(c)(2).

D. As ISP administrator I cannot conduct any investigative activity on my own. All investigations must be conducted by authorized personnel of law enforcement organizations.

There are few rules that I must follow in order to cooperate with investigators and provide necessary environment for successful investigation:

- Preserve necessary evidence according to Preservation Request Letter obtained from law enforcement officer according to U.S.C. § 2703(f)(1). There is limitation: this section of law specifies preservation of already existing data; if future communications need to be monitored, there should be compliance with requirements for electronic surveillance.
- Not to disclose existence of subpoena, court order or search warrant to any person this particular situation can fall under one or more of following:
 - Endangering the life or physical safety of an individual; 18 U.S.C. §2705(b)(1)
 - o flight from prosecution 18 U.S.C. § 2705(b)(2);
 - destruction of or tampering with evidence prosecution 18 U.S.C. §2705(b)(3);
 - intimidation of potential witnesses prosecution 18 U.S.C. §2705(b)(4);
 - otherwise seriously jeopardizing an investigation or unduly delaying a trial prosecution - 18 U.S.C. § 2705(b)(5).

Unconditionally, I cannot retaliate hackers attack – that will alert attacker that his/her activity was disclosed and monitored and this can cause unrecoverable damage to investigation.

<u>E.</u> In case when ISP logs disclosed fact that hacker gained unauthorized access to my system, created an account for his/her use and use that account to hack into government system, in addition to measures that are required from me in order to cooperate with law enforcement, I obtain some additional rights. In fact, proven unauthorized access to ISP system qualifies as an offence - under U.S.C. §2701(a)⁴². In addition to information requested by law enforcement, ISP "may divulge a record or other information, pertaining to a subscriber or customer of such service ... as may be necessary ... to the rendition of the service or to the protection of the rights or property of the provider of that service".

Question (\underline{E}) of Practical Assignment can be interpreted also other way – I discovered (by reviewing logs) that my ISP system was compromised and used as starting point for hacking into government computer, but I was not contacted by law enforcement officer. In this case, it is my responsibility to report this incident as soon as possible to appropriate law enforcement authorities (National Infrastructure Protection Center; FBI, US Secret Service, US Customs Service etc).⁴³

Activity of hacker described in scenario qualifies as fraud under U.S.C § 1030 $(a)(2-6)^{44}$. In addition to crime of hacking into government computer system, fact of obtaining unauthorized account on ISP and using it for hacking of other systems under U.S.C. §1030 (a)(1) qualifies as fraud and punishable with a fine or imprisonment up ten years (under U.S.C. §1030(c)(1)(A)) or up to twenty years (under U.S.C. §1030(c)(1)(B)) – depending of other convictions.

In case this incident would involve any party, located in state of New York, there additional considerations that can qualify this crime as computer tampering as first degree, because it meets the definition in <u>McKinney's Consolidated Laws Of New York Annotated Penal Law. Chapter 40, Part Three, Title J, Article 156⁴⁵, which is applicable in described scenario for the reason that hacker used compromised ISP system in order to commit or attempt to commit furter tampering. Under this legislation this crime qualifies as class E felony.</u>

Conclusion

For the last two years number of legislative acts and laws, related to cyber crime were introduced in the United States of America. There are few reasons for this:

Tragic events of September 11th, 2001, when organized group of international terrorists hijacked four passenger airplanes and destroyed Twin Towers in New York and attacked Pentagon in Washington, DC, killing thousands of people. Investigation of this monstrous crime proved that terrorists extensively used modern communication and computer technologies in order to prepare and conduct this act of terror;

- Few high-profile crimes (trial of David Smith author of Melissa virus⁴⁶; case of Gorshkov & Ivanov extortion of money⁴⁷; Gary McKinnon hacked numerous computers of US Army and NASA⁴⁸ etc) indicated that computer crime migrated from category of "exotic and rare" cases to which they belonged decade or more ago into mainstream of criminal activity;
- Changes in technology some of the laws that regulate computer-related crime were originally created 30-50 years ago (Atomic Energy Act, 1954; Omnibus Crime Control and Safe Streets Act of 1968) and contain technology-specific language [appropriate for level of technology of that time], sometimes affected effectiveness of investigation and trial;
- Omnipresence of computer technologies in every segment of modern life and reliance of virtually any critical element of infrastructure on data processing and electronic communications.

Two fundamental legislative acts that affects number of laws dealing with cyber crimes - <u>USA Patriot Act of 2001</u>⁴⁹ and <u>The Cyber Security Enhancement Act</u> (part of Homeland Security Act of 2002)⁵⁰.

Sections 210-212, 216, 217, 220, 814-816 of USA Patriot Act of 2001 make number of amendments to:

- Electronic Communications Privacy Act (ECPA) United States Code (U.S.C.) §§ 2701-2712,
- Computer Fraud and Abuse Act U.S.C. §1030;
- Pen Register and Trap and Trace Statute U.S.C. § 3121, 3123, 3124 and 3127.

These amendments have a goal of expanding scope of existing laws in order to provide coverage of existing and perspective communication and computer technologies, avoid ambiguity in interpreting these laws and provide more rights to law enforcement in order to facilitate persecution and prevention of computer related crimes.

Cyber Security Enhancement Act provides further enhancements to laws, related to computer crime. Namely, it amends following laws:⁵¹

- Title 18, Section 1030, Fraud and related activity in connection with computers
- Title 18, Section 2511, Interception and disclosure of wire, oral, or electronic communications prohibited
- Title 18, Section 2512, Manufacture, distribution, possession, and advertising of wire, oral, or electronic communication intercepting devices prohibited
- Title 18, Section 2517, Authorization for disclosure and use of intercepted wire, oral, or electronic communications
- Title 18, Section 2520, Recovery of civil damages authorized
- Title 18, Section 2701, Unlawful access to stored communications
- Title 18, Section 2702, Voluntary disclosure of customer communications or records

- Title 18, Section 2703, Required disclosure of customer communications or records
- Title 18, Section 3125 Emergency pen register and trap and trace device installation

This level of attention of government and legislators clearly indicates significance of contemporary, powerful and effective legislation for fighting with cyber crime.

η.

Appendixes

Appendix 1.1. Output of zipinfo -v binary v1.2.zip command

Note: Command <u>zipinfo</u> was executed with parameter $\underline{-v}$ – for verbose output.

zipinfo -v binary_v1.2.zip Archive: binary_v1.2.zip 7309 bytes 2 files

End-of-central-directory record:

Actual offset of end-of-central-dir record: 7287 (00001C77h) Expected offset of end-of-central-dir record: 7287 (00001C77h) (based on the length of the central directory and its expected offset)

This zipfile constitutes the sole disk of a single-part archive; its central directory contains 2 entries. The central directory is 102 (00000066h) bytes long, and its (expected) offset in bytes from the beginning of the zipfile is 7185 (00001C11h).

There is no zipfile comment.

Appendix 1.2. Output of strings -a -n 3 atd command

Notes:

1. <u>Strings</u> command was executed with parameters:

-a – Scan the entire file, not just the data section;

-n 3 - Locate & print any NUL-terminated sequence of at least 3 characters (default 4). I used this option, as it yielded few quite important strings that were skipped with default 4-character setting.

Running this program outputs all NUL-terminated strings that have 3 or more characters. This program behavior produces, together with meaningful strings some "noise" – sequences of characters that formally meet criteria of search, but in fact are just bytes of binary code that match the search pattern.

I filtered out these "noise" strings, as they do not add any information for forensic research. Some strings were repeated 8 times in a row – these were also filtered out.

2. Printout of command was re-formatted in 2 columns – for space considerations.

strings -a -n 3 atd

Appendix 1.6. Output of strings -a -n 3 lokid command

Notes:

1. Strings command was executed with parameters:

-a – Scan the entire file, not just the data section;

-n 3 - Locate & print any NUL-terminated sequence of at least 3 characters (default 4). I used this option, as it yielded few quite important strings that were skipped with default 4-character setting.

Running this program outputs all NUL-terminated strings that have 3 or more characters. This program behavior produces, together with meaningful strings some "noise" – sequences of characters that formally meet criteria of search, but in fact are just bytes of binary code that match the search pattern.

I filtered out these "noise" strings, as they do not add any information for forensic research. Some strings were repeated 8 times in a row – these were also filtered out.

2. Printout of command was re-formatted in 2 columns – for space considerations.

Appendix 2.2. – List of files used during execution of <u>SecReport</u> tool

Note: Results of FileMon program, that monitored system during execution of tool <u>SecReport</u>, were:

- 1. exported into Microsoft Excel;
- 2. sorted by name of used file;
- 3. column with sorted list of used files saved as tab-delimited text file;
- 4. executed command:

uniq -i FileMonSecReportSorted4.txt > FileMonSortedUniq.txt

This command outputs only unique lines; option "-i" makes it case-insensitive. Below is complete list of unique filenames, used by <u>SecReport</u> tool that was obtained as result of processing described above:

C:\??\C:\WINNT\system32\cmd.exe C:\autoexec.bat C:\boot.ini C:\cmdcons C:\Documents and Settings\ C:\Documents and Settings\Administrator\ C:\Documents and Settings\Administrator\Local Settings\Temp C:\Documents and Settings\All Users\Application Data C:\Documents and Settings\All Users\Application Data\Microsoft C:\Documents and Settings\All Users\Application Data\Microsoft\Crypto C:\Documents and Settings\All Users\Application Data\Microsoft\Crypto\RSA C:\Documents and Settings\All Users\Application Data\Microsoft\Crypto\RSA\MachineKeys C:\Documents and Settings\All Users\Application Data\Microsoft\Crypto\RSA\MachineKeys\3501338eaa4ef8df5fbadf23ada5f36a eb9aed62-6de3-4e57-8915-8b8fadb5dce2 C:\Tools\wshEN.DLL C:\Tools\wshENU.DLL C:\WINNT C:\WINNT\ C:\WINNT\hh.exe C:\WINNT\REPAIR\SETUP.LOG C:\WINNT\svstem\wldap32.dll C:\WINNT\system\wshEN.DLL C:\WINNT\system\wshENU.DLL C:\WINNT\system32 C:\WINNT\System32 C:\WINNT\System32\~CLBCATQ.DLL C:\WINNT\System32\ACTIVEDS.dll

Appendix 2.3. - Sample report produced by Delta tool

Notes:

- If some value printed without / (slash character), that means that values are identical for System1 and System2 (In this report, for example, values "OS Version" are identical for both systems).
- If some values printed with "/" slash between them, that means that value before slash is for System1, value after slash for System2. In this case, values are different. In example below, Media Player Version is different for systems.
- If some value has syntax:

Value1 / - that means that value exists only for System1 and does not exist for System2. In example below (Table "Services", entry "lanmanserver") service lanmanserver (and it's properties) exist only for System1.

• If some value has syntax:

/ Value2 - that means that value exists only for System2 and does not exist for System1. In example below (Table "Services", entry "DefWatch") service <u>DefWatch</u> (and it's properties) exist only for System2.

End of notes.

Differences between systems:

	System1	System2
Hostname	AK1	AK3
Date of report:	2003-03-08	2003-03-08
Time of report:	13:16:16	11:23:32

OS Version: Microsoft Windows XP Professional 5.1.2600 OS Service Pack: 1.0 IE Version: 6.0.2800.1106 Java VM Version: 5.0.3809.0 Media Player Version: 8.0.0.4487 And 6.4.9.1125 / 9.0.0.2980 WSH Version: 5.6.0.6626

Applications

Application	AK1	AK3
Cisco Systems VPN Client 3.6.3 (Rel) 3.6	Yes	No
CMD Prompt Here PowerToy	No	Yes
LiveUpdate 1.7 (Symantec Corporation)	No	Yes
Microsoft Visual Studio 6.0 Enterprise Edition	No	Yes

Microsoft Web Embedding Fonts Tool (III)	Yes	No
Microsoft Web Publishing Wizard 1.53	No	Yes
MP4DVD Video Decodec 1.0 Play release	No	Yes
MSDN Library - October 2001	No	Yes
Paint Shop Pro 7 7.0.2.0000	No	Yes
Panicware Pop-Up Stopper Companion	Yes	No
Run shell extension	No	Yes
Search and Replace	No	Yes
SpywareRemover 5.00.0000	No	Yes
Symantec AntiVirus Client 8.0.0.374	No	Yes
TextPad 4.6 4.6.0	Yes	No
TextPad 4.6 4.6.2	No	Yes
Tweakui Powertoy for Windows XP 1.00.0001	No	Yes
TweakVB	No	Yes
Window Washer	No	Yes
Windows Script V5.6 Documentation	No	Yes
WinZip 8.1 (4331)	Yes	No
WinZip 8.1 SR-1 (5266)	No	Yes

HotFixes

Hotfix	AK1	AK3
MS02-070 329170	No	Yes
MS03-001 810833	No	Yes
MS03-005 810577	No	Yes
MS03-004 810847	No	Yes
