# Practical Assignment for GIAC Intrusion Analyst Certification

Kathryn Lucas

Washington DC, 2000

## Table of contents

Assignment 1 – page 1

Assignment 2 – page 12

Assignment 3 – page 95

## Assignment 1 – Network Detects

Note: All of the detects were captured by the ASIM (Automated Security Incident Measurement) tool. Due to the nature of the archive system, not all of the detects are in the same format. A couple of the detects were only saved in a screen capture format (which could not be modified to protect addresses). This data has been manually entered in a MS Word table.

### Detect 1

Loadtime	Sensor	Event	Service	Src IP	Dst IP	Src Port	Dst Port
2000-06-21 23:38:01	site a	(8)String match on [.htr]	http [TCP]	evil.156	ournet1.5		80
2000-06-21 23:37:38	site a	(5)String match on [_vti_pvt]	http [TCP]	evil.156	ournet1.5		80

## 1. Source of trace

Live network. This incident occurred at three separate remote sites within a 15 minute time period. We have an IDS located at our home and remote sites.

## 2. Detect was generated by:

ASIM (Automated Security Incident Measurement) tool. ASIM looks at both the header information and data content. Only the summary information from the detect had been archived - and only as a screen capture. In order to hide the source/destination addresses, I have copied the screen capture into a table. The following is defined:

Loadtime: The date and time of the detect.

Sensor: The sensor which made the detect.

Event: A brief description of the event that triggered the detect.

Service: What service (sometime commands appear here) was accessed.

Src IP: The originating IP address. I have hidden the first 3 octets.

Dst IP: The target IP address. I have hidden the first 3 octets.

Src Port: What port the attack originated from. Note: The "distributed port scan" detect is a very broad event description. It is used to describe many types of port scans. Only particular detects list the src/dst ports. To see the actual src and dst ports, the detailed summary would have to be shown.

Dst Port: The destination port.

## 3. Probability the source address was spoofed:

None. The attacker is attempting to exploit a system, he needs the answers back to his system.

## 4. Description of attack:

In rows 3, 10, and 17 of the detect, the attacker is looking IIS vulnerabilities. One nasty vulnerability is RDS, which allows for remote access to ODBC components over the web, through msadc/msadcs.dll. Correlates to CVE-1999-1011 (Vulnerabilities in Microsoft Remote Data Service).

## 5. Attack mechanism:

The attacker does a "GET" request to /msadc/msadcs.dll on the targeted server. If msadcs.dll exists (determined by returning a particular response), then the server asks the user what command to run. At this point, the attacker knows he can send commands to the target and these commands will be run on the server with administrative privileges.

## 6. Correlations:

This is one of the top ten most critical Internet security threats (RDS security hole in the Microsoft IIS). A description of the vulnerability and how to correct it can be found at <http://www.wiretrip.net/rfp/p/doc.asp?id=29&iface=2>

## 7. Evidence of active targeting:

This is definitely active targeting. The attacker has already identified the web servers (all of the machines targeted were real web servers running IIS).

## 8. Severity:

Criticality of target: 4 (targets are key web servers )  
 Lethality of attack: 5 (attacker can run administrative commands on the host)  
 System Countermeasures: 5 (targets were patched)  
 Network Countermeasures: 0 (we have to have open web access)  
 Severity=(4+5)-(5+0)=4

## 9. Defensive recommendation:

Ensure all systems that have IIS/RDS installed are correctly patched (which they are). Just log the attempts. Probably block that IP address since they obviously have bad intentions.

## 10. Multiple choice test question:

Loadtime	Sensor	Event	Service	Src IP	Dst IP	Src Port	Dst Port
23:38:01	site a	(8)String match on [.htr]	http [TCP]	evil.156	ournet1.5		80
23:37:38	site a	(5)String match on [_viti_pvt]	http [TCP]	evil.156	ournet1.5		80
23:37:01	site a	String match on [msadcs.dll]	http [TCP]	evil.156	ournet1.5		80
23:34:11	site a	String match on [showcode]	http [TCP]	evil.156	ournet1.5		80
23:33.11	site a	String match on [.htr]	http [TCP]	evil.156	ournet1.5		80
23:32:52	site a	String match on [_vit_pvt]	http [TCP]	evil.156	ournet1.5		80
23:32:45	site a	String match on [.htr]	http [TCP]	evil.156	ournet1.5		80

The above detect shows:

- Attacker looking for buffer overflow vulnerabilities.
- Attacker looking for IIS vulnerabilities.
- Attacker looking for web servers.
- Attacker looking for planted trojan code.

answer (b)

\*\*\*\*\*  
 \*\*\*\*\*

## Detect 2

```

### 1. Source of trace:

Live network. This incident occurred at one of our remote sites. The attacker was not one of our hosts. We have an IDS located at our home and remote sites.

### 2. Detect was generated by:

ASIM (Automated Security Incident Measurement) tool. ASIM looks at both the header information and data content. This report details the actual trace (using the "snoop" command) of the session. It is the content of the data (the word "root") which generated this detect.

### 3. Probability the source address was spoofed:

None. The attacker is attempting to exploit a system, he needs the answers back to his system. The attacking host may have been a compromised host, but we are not allowed to contact the attacking sites.

### 4. Description of attack:

The user is attempting to gain root access to the system by using default or easily guessable passwords (in this case, the attacker tried sysadmin). Correlates to CVE Candidates CAN 1999-501 (A Unix account has a guessable password) and CAN 1999-502 (A Unix account has a default, null, blank, or missing password).

### 5. Attack mechanism:

The attacker connects to the telnet port of a host and attempts to login as "root", the superuser of the host. The attacker guesses obvious passwords (sysadmin, root, admin, etc). If he/she guesses correctly, they will have administrative control over the target. Most likely, the attacker will modify the system so that they can return to the host at a later time without have to login as root directly. This will make it harder to detect intrusions to the target.

### 6. Correlations:

This is one of the top ten most critical Internet security threats (User Ids, especially root/administrator with no passwords or weak passwords).

### 7. Evidence of active targeting:

The attacker has identified a host on which the telnet daemon is running. This may be luck, or he may have done previous reconnaissance..

### 8. Severity:

Criticality of target: 2 (user workstation)

Lethality of attack: 5 (attacker would have control over target)

System Countermeasures: 4 (strong root password, but allowed remote root logins)

Network Countermeasures: 0 (allowed telnet from outside our organization)  
Severity=(2+5)-(4+0)=2

**9. Defensive recommendation:**

The firewall should be configured to allow only our remote hosts to telnet inside the firewall.  
The target should be modified to allow root login only at the console.

**10. Multiple choice test question:**

The following is one of the top 10 critical Internet security threats:  
a. Administrator accounts with no passwords or weak passwords.  
b. Sesquipedalian attacks  
c. Smurf attacks  
d. Apache Web servers with default configuration

answer (a)

\*\*\*\*\*  
\*\*\*\*\*

## Detect 3

-----  
00072915:41:07  
-----

ASIM alert: Distributed Port Scan!  
evil.116:1759 -> ournet2.137:98 (6)

evil.116:4802 -> ournet3.224:98 (6)  
evil.116:1699 -> ournet2.77:98 (6)  
evil.116:4801 -> ournet3.223:98 (6)

RULE\_MATCHED:200  
Timestamp Sat Jul 29 20:44:43 GMT 2000

**1. Source of trace:**

Live network. This incident occurred at one of our remote sites. The attacker was not one of our hosts. We have an IDS located at our home and remote sites.

**2. Detect was generated by:**

ASIM (Automated Security Incident Measurement) tool. ASIM looks at both the header information and data content. This report is a summary of the detect (the events that triggered the event). The detect was triggered by the destination ports. The most recent detects are at the bottom. The "(6)" in the output indicates tcp data.

### 3. Probability the source address was spoofed:

None. The attacker is looking for a particular service to exploit. He needs the answers back to his system. The attacking host may have been a compromised host, but we are not allowed to contact the attacking sites.

### 4. Description of attack:

The attacker is scanning to see if the linuxconf tool running on the host. This Correlates to CVE Candidate 2000-0017 (Buffer overflow in Linux linuxconf package allows remote attackers to gain root privileges via a long parameter).

### 5. Attack mechanism:

The attacker is sending a tcp Syn packet to port 98 on a large number of targets to see if any respond with a Syn/Ack. If a target responds with a Syn/Ack, it is possible that the linuxconf utility is running on the target. The attacker will then send a command (with a very long parameter) to port 98 on the identified target. Hopefully, this will generate a buffer overflow and the attacker will be able to obtain root access to the target.

### 6. Correlations:

This mechanisms for the actual attack on linuxconf are outlined at <http://marc.theaimsgroup.com/?l=bugtraq&m=94580196627059&w=2>, but note that CVE CAN 2000-0017 states that the linuxconf author was unable to duplicate the vulnerability. Other than the cited reference, I could find no real reports of successful exploits.

### 7. Evidence of active targeting:

The attacker is looking for likely candidates for attack. By looking at the source ports, it looks like the attacker has 3 different scans running (for each of the 3 subnets being scanned, there is a different increment of source ports). This scan was hitting non-linux hosts, so the attacker had not done any previous O/S fingerprinting (or wanted us to think that he had not).

### 8. Severity:

Criticality of target: 1 (random targeting)

Lethality of attack: 5 (attacker would gain root access if the exploit is real)

System Countermeasures: 5 (linuxconf not running)

Network Countermeasures: 0 (port 98 allowed through)

Severity=(1+5)-(5+0)=1

### 9. Defensive recommendation:

Continue to monitor and log the scans. Minimal concern since linuxconf doesn't run at our sites.

### 10. Multiple choice test question:

evil.116:1759 -> ournet2.137:98 (6)

evil.116:4860 -> ournet1.27:98 (6)

evil.116:4853 -> ournet1.20:98 (6)

evil.116:1750 -> ournet2.128:98 (6)

evil.116:4820 -> ournet3.242:98 (6)

evil.116:1710 -> ournet2.88:98 (6)

```

evil.116:1708 -> ournet2.86:98 (6)
evil.116:1707 -> ournet2.85:98 (6)
evil.116:1706 -> ournet2.84:98 (6)
evil.116:1705 -> ournet2.83:98 (6)
evil.116:1704 -> ournet2.82:98 (6)
evil.116:1703 -> ournet2.81:98 (6)
evil.116:1702 -> ournet2.80:98 (6)
evil.116:1701 -> ournet2.79:98 (6)
evil.116:1700 -> ournet2.78:98 (6)
evil.116:4802 -> ournet3.224:98 (6)
evil.116:1699 -> ournet2.77:98 (6)
evil.116:4801 -> ournet3.223:98 (6)

```

The above output is an example of:

- a. Scan for the finger daemon.
- b. Scan for the IMAP daemon
- c. Scan for the linuxconf utility
- d. Scan for the reverse ident daemon

answer ( c )

```

2000-07-30 07:08:03	site a	distributed port scan		evil.206	ournet7.56		

### 1. Source of trace:

Live network. This incident occurred at a remote site. We have an IDS located at our home and remote sites.

## 2. Detect was generated by:

ASIM (Automated Security Incident Measurement) tool. ASIM looks at both the header information and data content. Only the summary information from the detect had been archived - and only as a screen capture. In order to hide the source/destination addresses, I have copied the screen capture into a table. The following is defined:

Loadtime: The date and time of the detect.

Sensor: The sensor which made the detect.

Event: A brief description of the event that triggered the detect. Note:

Service: What service (sometimes commands appear here) was accessed.

Src IP: The originating IP address. I have hidden the first 3 octets.

Dst IP: The target IP address. I have hidden the first 3 octets.

Src Port: What port the attack originated from. Note: The "distributed port scan" detect is a very broad event description. It is used to describe many types of port scans. Only particular detects list the src/dst ports. To see the actual src and dst ports, the detailed summary would have to be shown.

Dst Port: The destination port.

This detect of interest row 7 of the table was generated from scanning the data portion of the packet.

## 3. Probability the source address was spoofed:

None. The attacker is looking for a particular service to exploit. He needs the answers back to his system. The attacking host may have been a compromised host, but we are not allowed to contact the attacking sites.

## 4. Description of attack:

The attacker is scanning hosts to see if the ftp service is running. In row 7 of the output, we see that the attacker has found an ftp server on which he was able to login. In this case, the target had anonymous ftp enabled. This correlates to CVE Candidate 1999-0497 (Anonymous FTP is enabled). Also, the attacker could be looking for specific ftp versions (wuftp for example) which are associated with multiple exploits. See CVEs 1999-0075, 1999-0080, 1999-0081, 1999-0368, 1999-0720, 1999-0878, 1999-0879, 1999-0880, 1999-0955, 1999-0977 and CANs 1999-0076, 1999-0156, 1999-661, 1999-0911, 2000-0573.

## 5. Attack mechanism:

The attacker is sending a tcp Syn packet to the ftp port on a large number of targets to see if any respond with a Syn/Ack. If a target responds with a Syn/Ack, it is very likely that the ftp service is running on the target. Note that the attacker was stepping through class C addresses (this is hidden using my "ournet" substitution). The attacker will then attempt to login the target. In this case, the login was done via anonymous ftp. The user executed a "mkdir" command to make a directory on the target. This may or may not be a bad thing. The attacker could be using our server to store/execute illegal/malicious software. If the attacker were looking for a vulnerable version of ftp, he could attempt one of the well-know ftp exploits.

## 6. Correlations:

This is a typical scan for the ftp service. This is a normal attempt to use an anonymous ftp service for devious purposes. There are many well-know exploits associated with particular versions of the ftp service.

## 7. Evidence of active targeting:

The attacker has not narrowed down a target. He is scanning many several hosts in several address spaces. Even after making one successful connection, he continues to search for more.

### 8. Severity:

Criticality of target: 2 (random targeting – host accessed was a workstation – not running vulnerable ftp service)

Lethality of attack: 2 (didn't see anything bad done)

System Countermeasures: 2 (we had anonymous ftp turned on)

Network Countermeasures: 0 (allow ftp connects from outside)

Severity=(2+2)-(2+0)=2

### 9. Defensive recommendation:

Turn off anonymous ftp. Configure firewall to allow ftp connections only to valid ftp servers.

Ensure ftp services have been patched to disallow exploits on valid ftp servers.

### 10. Multiple choice test question:

Loadtime	Sensor	Event	Service	Src IP	Dst IP	Src Port	Dst Port
2000-07-30 08:05:05	site a	distributed port scan		evil.206	ournet4.122		21

2000-07-30 07:52:08	site a	String match on [ MKD ]	ftp [TCP]	evil.206	ournet0.102	4795	21
2000-07-30 07:47:25	site a	distributed port scan		evil.206	ournet2.143		21
2000-07-30 07:46:14	site a	distributed port scan		evil.206	ournet1.145		21
2000-07-30 07:41:14	site a	distributed port scan		evil.206	ournet1.145		21
2000-07-30 07:40:09	site a	distributed port scan		evil.206	ournet0.158		21

The above output most likely indicates:

- A buffer overflow attack of the WU-ftp ftp service
- A user creating a directory on an ftp server
- A specific targeted ftp scan
- Activating of a trojan service

RULE\_MATCHED:200

Timestamp Thu Jul 27 21:21:56 GMT 2000

### 1. Source of trace:

Live network. This incident occurred at a remote site. We have an IDS located at our home and remote sites.

### 2. Detect was generated by:

ASIM (Automated Security Incident Measurement) tool. ASIM looks at both the header information and data content. This report is a summary of the detect (the events that triggered the event). The detect was triggered by the destination ports. The most recent detects are at the top. The "(6)" in the output indicates tcp data.

### 3. Probability the source address was spoofed:

None. The attacker is looking for a DNS server to exploit. He needs the answers back to his system. The attacking host may have been a compromised host, but we are not allowed to contact the attacking sites.

### 4. Description of attack:

This a standard probe for DNS servers. Once a DNS service is identified, there are many associated DNS vulnerabilities (too many to list here).

### 5. Attack mechanism:

The attacker is sending a tcp Syn packet to the DNS port on a large number of targets to see if any respond with a Syn/Ack. If a target responds with a Syn/Ack, it is very likely that the DNS service is running on the target. There are a large number of DNS vulnerabilities associated with DNS. Once attacker has identified a DNS target, he will most likely send a UDP packet looking for the version of BIND running on the target. The attacker will further use that information to pick an exploit to run against the target. Additionally, the attacker may attempt to do a zone transfer and with the intent of putting bogus information in our DNS cache. Bogus information in the DNS cache could redirect users to possibly malicious sites.

### 6. Correlations:

DNS servers are well known. Commonly probed ports are found at <http://www.sans.org/y2k/ports.htm>.

### 7. Evidence of active targeting:

The attacker has not narrowed down a target. He is scanning many several hosts in several address spaces. He is only looking for potential targets.

## 8. Severity:

Criticality of target: 4 (DNS servers are vulnerable)

Lethality of attack: 2 (haven't seen what he's planning to do – could be bad)

System Countermeasures: 3 (our DNS servers are not always what they should be)

Network Countermeasures: 0 (we don't really filter for DNS source/destinations)

Severity=(4+2)-(3+0)=3

## 9. Defensive recommendation:

Ensure that the DNS hosts have all patches and latest BIND versions. Have the firewall allow zone transfers from only authorized hosts.

## 10. Multiple choice test question:

```
evil.33:1043 -> ournet1.5:53 (6)
evil.33:1039 -> ournet1.1:53 (6)
evil.33:1025 -> ournet2.242:53 (6)
evil.33:1029 -> ournet2.246:53 (6)
evil.33:1101 -> ournet1.62:53 (6)
evil.33:1102 -> ournet1.63:53 (6)
evil.33:1098 -> ournet1.59:53 (6)
evil.33:1097 -> ournet1.58:53 (6)
evil.33:1093 -> ournet1.54:53 (6)
evil.33:1094 -> ournet1.55:53 (6)
evil.33:1090 -> ournet1.51:53 (6)
evil.33:1089 -> ournet1.50:53 (6)
evil.33:1086 -> ournet1.47:53 (6)
evil.33:1085 -> ournet1.46:53 (6)
evil.33:1081 -> ournet1.43:53 (6)
evil.33:1080 -> ournet1.42:53 (6)
evil.33:1077 -> ournet1.39:53 (6)
evil.33:1076 -> ournet1.38:53 (6)
```

The above output is an example of:

- Multiple DNS zone transfers
- Probes for DNS servers
- A result of a DNS request for a lists of hosts in a domain
- BIND version requests

answer (b)

## Assignment 2 – Evaluate an Attack

### Command used:

`nmap -sS dolphin` (output from nmap follows):

Starting nmap V. 2.53 by fyodor@insecure.org ( [www.insecure.org/nmap/](http://www.insecure.org/nmap/) )

WARNING: your system apparently does not offer `sprintf()`. Reverting to less secure version

Interesting ports on dolphin (mynet.196):

(The 1510 ports scanned but not shown below are in state: closed)

Port	State	Service
21/tcp	open	ftp
23/tcp	open	telnet
37/tcp	open	time

```

111/tcp open sunrpc
513/tcp open login
514/tcp open shell
515/tcp open printer
2766/tcp open listen
4045/tcp open lockd
6000/tcp open X11
6112/tcp open dtspc
32771/tcp open sometimes-rpc5
32772/tcp open sometimes-rpc7

```

Nmap run completed -- 1 IP address (1 host up) scanned in 1 second

The command was run on a UNIX host (nosws601) and it was set to scan another UNIX host (dolphin)

### Description of the attack and how it works:

Nmap software has 3 purposes: 1) ping a number of hosts to determine if they are alive or not, 2) portscan hosts to determine what services are listening, and 3) attempt to determine the OS of the hosts.. SYN scans (-sS) are the workhorse of scanning methods. I used nmap to do reconnaissance and determine which services are listening (nmap -sS).

The way in which nmap checks for services is by using SYN scans (or "half-open" scans). Nmap sends a SYN packet, and looks in the return packet from the scanned host. There are 2 possible response packets from the target:

1. SYN|ACK . This indicates that the port (service) is open. In this case, nmap will send a RST packet to tear down the connection. The TCP 3-way handshake never gets completed.
2. RST . This indicates that the port (service) is closed. No return packet is sent by nmap.

By default nmap scans all ports between 1 and 1024 as well as any ports listed in the services file which comes with nmap. Nmap also randomizes the order of the destination ports when performing the scan.

The reason that this scan is effective in the real world is that this scan will work anytime a connect scan would have worked. They are unlikely to be detected by software such as tcp-wrappers since a connection never gets made (the TCP 3-way handshake doesn't get completed). A packet filtering firewall would be able to detect and/or block these packets.

### Provide an annotated network trace of the attack in action:

The network trace was produced by tcpdump software. My annotations are in boldtype. I am only annotating one example of a listening service (ftp) and one example of a non-listening service (exec).

Note: Same source port used by nmap host for every connection.

```

21:21:00.954150 nosws601 > dolphin: icmp: echo request (DF) nmap pings target to see if it is up

## Assignment 3 – “Analyze This” Scenario

For each detect file, there is a brief synopsis of what was seen in each detect. The below recommendations are based on the types of traffic seen in the detects. **NOTE: Below the recommendations and list of possibly compromised hosts are my “free form” thoughts while looking at the detects.**

**Recommendations (all depend upon business rules):**

1. When a scanning host is detected, block that IP from further access. If it is a legit host, the sysadmin will get in touch with you and you can talk about the scans. Letting the scans in provides valuable information to the scanner.
2. Modify the firewall to reject packets with anomalous flags. There were a lot of SF, Xmas, SFP AU, and reserved bits set. These types of packets can cause some systems to crash, and it also allows O/S fingerprinting in some cases.  

```

May 24 20:33:55 194.247.69.132:27045 -> MY.NET.20.10:27005 XMAS ***F*P*U

```
3. Block Napster traffic (ports 6699, 6700). Napster sites are notorious as hiding places for trojan code.  

```

05/16-04:02:27.687936  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.32.109:29136 -> MY.NET.53.67:6699

```
4. There is a lot of searching from the outside for proxy servers (wingate, http). Block anyone from using your host as a proxy – you can’t know what their intentions are. You also don’t want people coming from a unknown proxy site to you (they’re hiding their identity).  

```

05/26-09:34:08.734424  [**] WinGate 8080 Attempt [**] 64.67.15.98:12360 ->
MY.NET.253.105:8080
05/26-16:02:02.030558 [**] WinGate 8080 Attempt [**] 63.27.117.212:1571 ->
MY.NET.97.69:8080

```
5. Limit the number of hosts to which SMTP connections can be made (make specific mail hosts). This should allow you to restrict port 25 connections to only valid internal hosts.
6. Shut off inbound traffic for the following dest ports (probes were seen to all dest ports):
  - a) 113 – sites are using it to get to the identd (find out who owns your tcp connections)  

```

05/27-00:42:55.440819  [**] Watchlist 000222 NET-NCFC [**]

- k) 111 portmapper should be blocked.  
 06/22-20:58:00.651205 [\*] External RPC call [\*] 212.25.68.195:637 ->  
 MY.NET.6.15:111
- l) 143 imap should be blocked if not used. Has many vulnerabilities.  
 Jun 22 20:58:08 212.25.68.195:2331 -> MY.NET.105.109:143 SYN \*\*S\*\*\*\*\*
- m) This could be Xwindows traffic. Block if not required.  
 06/23-15:42:32.334888 [\*] SUNRPC highport access! [\*] 24.3.28.220:6000  
 -> MY.NET.99.51:32771
7. Saw the Happy virus some in. Might want to scan for that.  
 05/25-09:53:44.364111 [\*] Happy 99 Virus [\*] 207.172.145.30:1294 ->  
 MY.NET.253.51:25
8. Turn off public access to the snmp agent on MY.NET.101.192.  
 05/26-08:01:02.137479 [\*] SNMP public access [\*] MY.NET.97.59:1054 ->  
 MY.NET.101.192:161

## Possibly compromised hosts:

1. MY.NET.20.10. is a potential target host. There was a concentrated effort over the entire period covered by the detects to attack this box. This box should be thoroughly checked for possible compromise. Below are samples of the types of attacks against the box. The scans were also very well time-spaced. The attacks usually came in groups of less than 20 packets, and the attacks came from a variety of hosts.

05/27-16:23:06.652122 [\*\*] Queso fingerprint [\*\*] 194.159.250.7:27035 ->

2. MY.NET.217.74 is a potential target host. There was a concentrated effort over the entire period covered by the detects to attack this box. This box should be thoroughly checked for possible compromise. Below are samples of the types of attacks against the box. The scans were also very well time-spaced. The attacks usually came in groups of less than 20 packets, and the attacks came from a variety of hosts.

```

05/26-00:44:43.029177 [\*\*] WinGate 8080 Attempt [\*\*] 172.138.242.25:1036 -> MY.NET.253.105:8080

### Compromised host – trinoo ports (Kazimas uses this)

05/26-10:52:31.465183 [\*\*] GIAC 000218 VA-CIRT port 34555 [\*\*] 132.151.1.176:113 ->  
MY.NET.100.230:34555  
05/26-15:43:00.448751 [\*\*] Watchlist 000222 NET-NCFC [\*\*] 159.226.63.200:1652 ->  
MY.NET.100.230:113  
05/26-12:16:20.156716 [\*\*] GIAC 000218 VA-CIRT port 35555 [\*\*] 156.80.1.4:25 ->  
MY.NET.253.24:35555

### trinoo

05/26-18:43:28.020643 [\*\*] GIAC 000218 VA-CIRT port 34555 [\*\*] MY.NET.253.52:25 ->  
MY.NET.101.89:34555  
05/26-22:01:22.934985 [\*\*] GIAC 000218 VA-CIRT port 34555 [\*\*] 209.132.14.36:25 ->  
MY.NET.6.35:34555

### Need to turn off public access to snmp (seen lots of these)

05/26-08:01:02.137479 [\*\*] SNMP public access [\*\*] MY.NET.97.59:1054 -> MY.NET.101.192:161  
05/26-08:01:02.181304 [\*\*] SNMP public access [\*\*] MY.NET.97.59:1054 -> MY.NET.101.192:161  
05/26-08:01:04.689386 [\*\*] SNMP public access [\*\*] MY.NET.97.59:1057 -> MY.NET.101.192:161

### Dial-in access to the network

05/26-09:07:07.750003 [\*\*] Watchlist 000220 IL-ISDNNET-990517 [\*\*] 212.179.31.2:1396 ->  
MY.NET.201.122:5500  
05/26-09:07:10.712615 [\*\*] Watchlist 000220 IL-ISDNNET-990517 [\*\*] 212.179.31.2:1396 ->  
MY.NET.201.122:5500  
05/29-23:21:20.710689 [\*\*] Watchlist 000220 IL-ISDNNET-990517 [\*\*] 212.179.5.131:25 ->  
MY.NET.253.51:38247  
05/29-23:21:22.481370 [\*\*] Watchlist 000220 IL-ISDNNET-990517 [\*\*] 212.179.5.131:25 ->  
MY.NET.253.51:38247  
05/29-23:21:22.676548 [\*\*] Watchlist 000220 IL-ISDNNET-990517 [\*\*] 212.179.5.131:25 ->  
MY.NET.253.51:38247

### Lots of access attempts (by different sites) to these hosts – are they on a list somewhere

05/26-09:34:08.734424 [\*\*] WinGate 8080 Attempt [\*\*] 64.67.15.98:12360 ->  
MY.NET.253.105:8080  
05/26-16:02:02.030558 [\*\*] WinGate 8080 Attempt [\*\*] 63.27.117.212:1571 ->  
MY.NET.97.69:8080
